

## Overview

CH32V series is an industrial-grade general-purpose microcontroller based on QingKe RISC-V core, including CH32V305 connected MCU, CH32V307/317 interconnected MCU, CH32V208 wireless MCU, etc. The CH32V30x and CH32V31x series is based on QingKe V4F microprocessor design, supports single-precision floating-point instruction and fast interrupt response, supports 144MHz main frequency zero-wait operation, provides 8 groups of U(S)ART, 4 groups of motor PWM advanced timers, SDIO, DVP, 4 groups of analog OPA, dual ADC units, dual DAC units, built-in USB2.0 high-speed PHY transceivers (480Mbps), Gigabit Ethernet MAC controller and 10M PHY transceivers, 10/100M PHY transceiver (CH32V317 only).

## Features

- **Core:**
  - QingKe 32-bit RISC-V4F core with multiple instruction set combinations
  - Fast programmable interrupt controller + hardware interrupt stack
  - Branch prediction, conflict handling mechanism
  - Single cycle multiplication, hardware division, hardware FPU
  - System main frequency 144MHz, zero wait
- **Memory:**
  - Available with up to 128KB volatile data storage area SRAM
  - Available with 480KB program memory CodeFlash (zero-wait application area + non-zero-wait data area)
  - 28KB BootLoader
  - 128B non-volatile system configuration memory
  - 128B user-defined memory
- **Power management and low-power consumption:**
  - System power supply  $V_{DD}$ : 3.3V
  - Independent power supply for GPIO unit  $V_{IO}$ : 3.3V
  - Low-power mode: Sleep, Stop, Standby
  - $V_{BAT}$  independently powers RTC and backup register
- **Clock & Reset**
  - Built-in factory-trimmed 8MHz RC oscillator
  - Built-in about 40 kHz RC oscillator
  - Built-in PLL, optional CPU clock up to 144MHz
  - High-speed external 3~25MHz oscillator
  - Low-speed external 32.768kHz oscillator
  - Power on/down reset, programmable voltage detector
- **Real-time clock (RTC): 32-bit independent RTC timer**
- **2 groups of 18-channel general-purpose DMA controllers**
  - 18 channels, support ring buffer
  - Support TIMx/ADC/DAC/USART/I2C/SPI/I2S/SDIO
- **4 groups of OPAs and comparators: connected with ADC and TIMx**
- **2 groups of 12-bit DAC**
- **2 groups of 12-bit ADC**
  - Analog input range:  $V_{SSA} \sim V_{DDA}$
  - 16 external signals + 2 internal signals
  - On-chip temperature sensor
  - Dual ADC conversion mode
- **16-channels Touch-Key detection timers**
- **Multiple timers**
  - 4×16-bit advanced timers, support dead-zone control and emergency braking, provide PWM complementary output for motor control
  - 4×16-bit general-purpose timers, provide input capture/output comparison/PWM/pulse counting/incremental encoder input
  - 2 basic timers
  - 2 watchdog timers (independent watchdog and window watchdog)
  - SysTick: 64-bit counter

- **Communication interfaces:**

- 8 USART interfaces (including 5 UARTs)
- 2 I2C interfaces (support SMBus/PMBus)
- 3 SPI interfaces (SPI2, SPI3 for I2S2, I2S3)
- USB2.0 full-speed host/device interface, built-in PHY
- USB2.0 full-speed OTG interface
- USB2.0 high-speed host/device interface, built-in PHY
- 2 CAN interfaces (2.0B active)
- SDIO host interface (MMC, SD/SDIO, CE-ATA)
- FSMC memory interface

- Digital video port (DVP)
- Gigabit Ethernet MAC controller, 10M PHY transceiver
- 10/100M PHY transceiver (CH32V317 only)

- **Fast GPIO port**

- 80 I/O ports, mapping 16 external interrupts

- **Security features: CRC unit, 96-bit unique ID**

- **Debug mode: 2-wire serial debug interface (SDI)**

- **Package: LQFP, QFN or TSSOP**

## Chapter 1 Series Product Description

CH32V series products are industrial-grade general-purpose enhanced MCU based on 32-bit RISC-V instruction set architecture, which are divided into general, connected, wireless and other categories according to functional resources. They extend each other in terms of package category, peripheral resources and quantity, pin number and device characteristics, but maintain mutual compatibility in software, function and hardware pin configuration. It provides freedom and convenience for users to carry out product iteration and rapid application in product development.

For the features of this series of products, please refer to the datasheet.

For the peripheral function description, usage and register configuration, please refer to "CH32FV2\_V3RM".

The datasheets and reference manuals can be downloaded on the official website of WCH: <https://wch-ic.com>

Information about the RISC-V instruction set architecture can be downloaded from: <https://riscv.org/>

This manual is for CH32V303, CH32V305, CH32V307, CH32V317 series datasheet. Please refer to CH32V203DS0 for V203 series and CH32V208DS0 for V208 series.

## Abbreviations:

ADTM: Advanced-control timer

GPTM: General-purpose timer

GPTM (32): 32-bit General-purpose timer

BCTM: Basic timer

OPA: Operational amplifier/comparator

RNG: Random number generator

USB: Universal serial bus full-speed device

USBFS: Universal serial bus full-speed host/device

USBHS: Universal serial bus high-speed host/device

## Chapter 2 Specification

CH32V30x and CH32V31x series is a 32-bit RISC-V core MCU based on QingKe V4F microprocessor. It works at 144MHz frequency and has built-in high-speed memory. Multiple buses work synchronously in the system structure, providing rich peripheral functions and enhanced I/O ports. This series includes 2 12-bit ADC modules, 2 12-bit DAC modules, multiple timers, multi-channel touch key capacitance detection (TKey) and other functions, as well as standard and dedicated communication interfaces: I2C, I2S, SPI, USART, SDIO, CAN controller, USB2.0 full-speed host / device controller, USB2.0 high-speed host / device controller (built-in 480Mbps transceiver), digital image interface, Gigabit Ethernet controller, etc.

The rated working voltage of the product is 3.3V, and the working temperature range is  $-40^{\circ}\text{C}\sim 85^{\circ}\text{C}$  in industrial grade. It supports several power-saving operating modes to meet the product's low-power application requirements. Various models in the series are different in terms of resource allocation, number of peripherals, peripheral functions, etc., and can be selected as needed.

### 2.1 Model Comparison

Note: 1. The products with 256K FLASH+64K SRAM support user select word to be configured as one of several combinations of (192K FLASH+128K SRAM), (224K FLASH+96K SRAM), (256K FLASH+64K SRAM), (288K FLASH+32K SRAM). On this basis, the 256K FLASH+64K SRAM product with the sixth inverted batch number not equal to 0 has also added a configuration combination: (128K FLASH+192K SRAM). FLASH flash represents the zero-waiting running area R0WAIT, and the product of 256K FLASH+64K SRAM supports the non-zero waiting area of (480K-R0WAIT) bytes.

3. The functions related to pin signals such as PWM and capture in the timer need to be combined with the pins packaged in the actual chip, and some packaged chips cannot be used without being led out.

	FSMC		-	
CPU main frequency			Max: 144MHz	
Operating temperature			Industrial-grade: -40°C~85°C	
Package form			QFN68	LQFP100

Note:

1. CH32V317 supports one of several combinations of (192K FLASH+128K SRAM), (224K FLASH+96K SRAM), (256K FLASH+64K SRAM), (288K FLASH+32K SRAM) and (128K FLASH+192K SRAM). FLASH flash represents a zero-waiting running area R0WAIT, and CH32V317 supports a non-zero waiting area of (480K-R0WAIT) bytes.

2. PWM, capture and other functions related to pin signals in the timer need to be combined with the pins of the actual chip package, and some packaged chips cannot be used without being led out.

## 2.2 System Architecture

The microcontroller is based on the RISC-V instruction set architecture (ISA) in which the core, arbitration unit, DMA module, SRAM storage and other parts are interacted through multiple sets of buses. A general-purpose DMA controller is integrated in the chip to reduce the burden on the CPU and improve access efficiency. The application of a multi-level clock management mechanism reduces the operating power consumption of peripherals. At the same time, it has a data protection mechanism and measures such as automatic clock switching

protection to increase system stability. The following figure is a block diagram of the overall internal structure of the series of products.

Figure 2-1-1 CH32V303/305/307 System block diagram

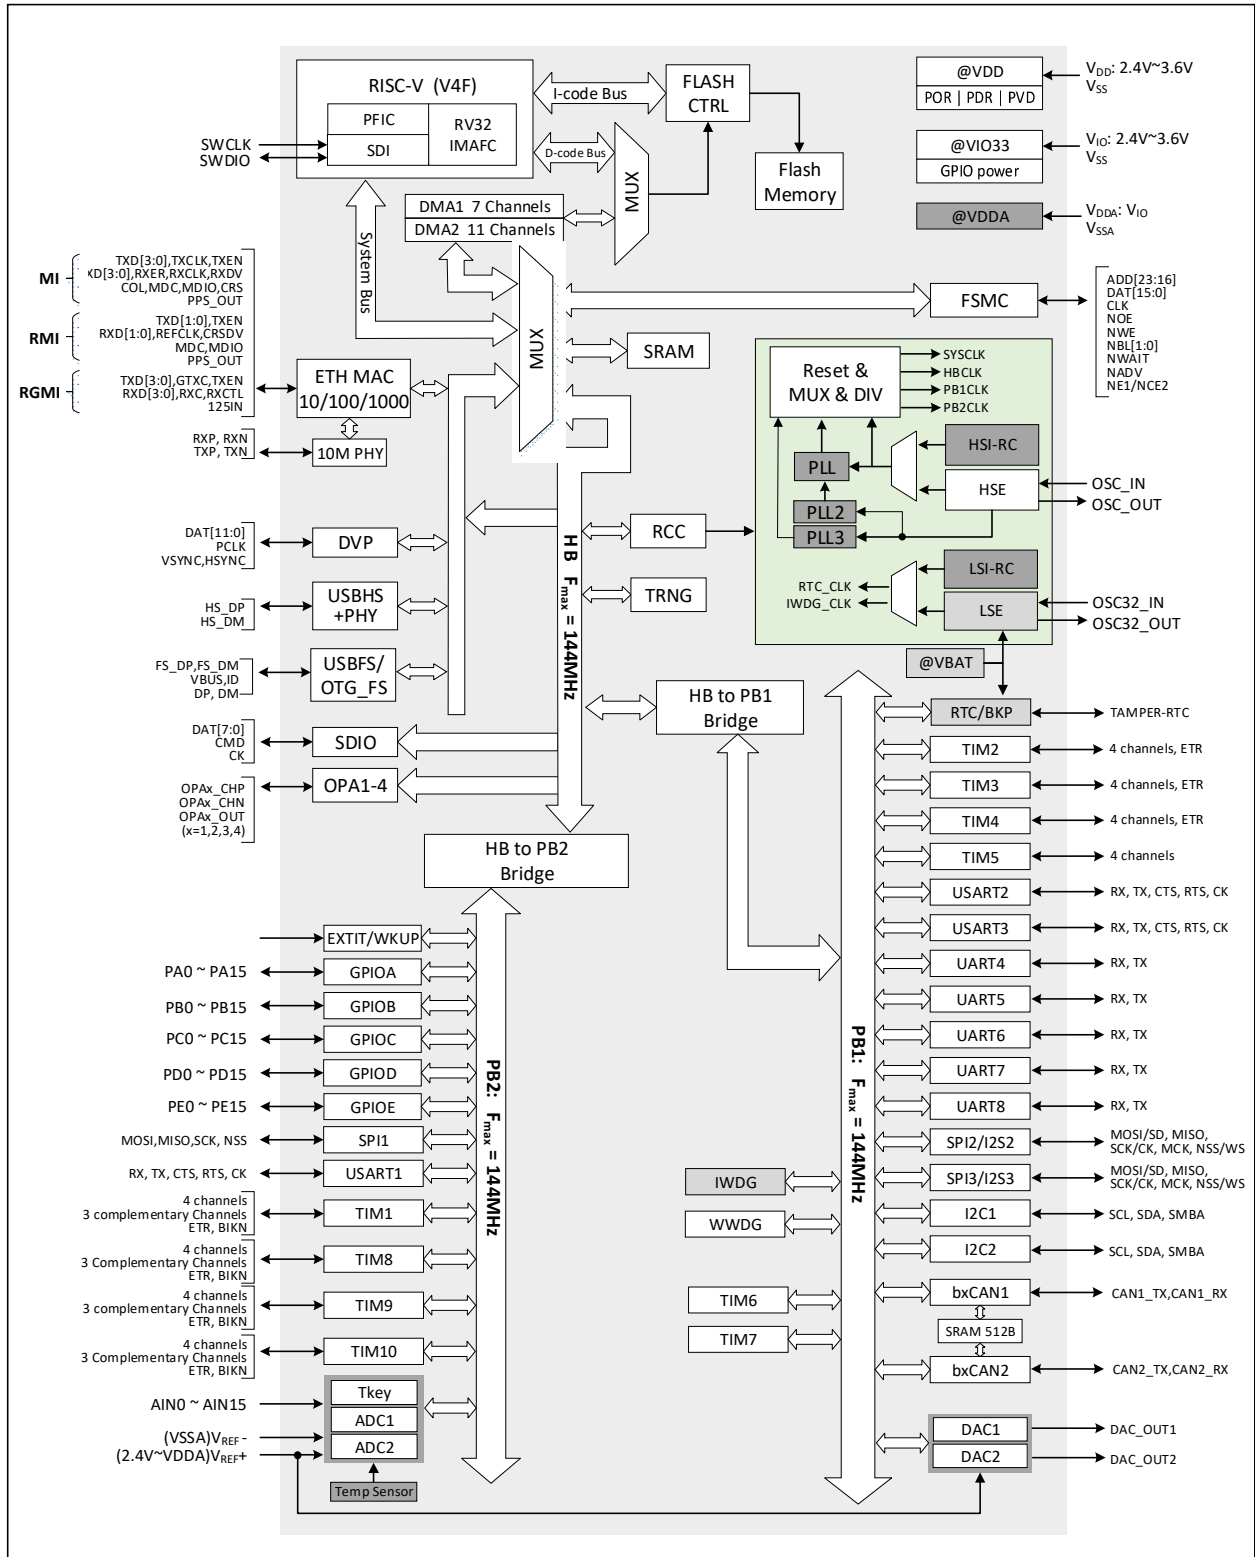

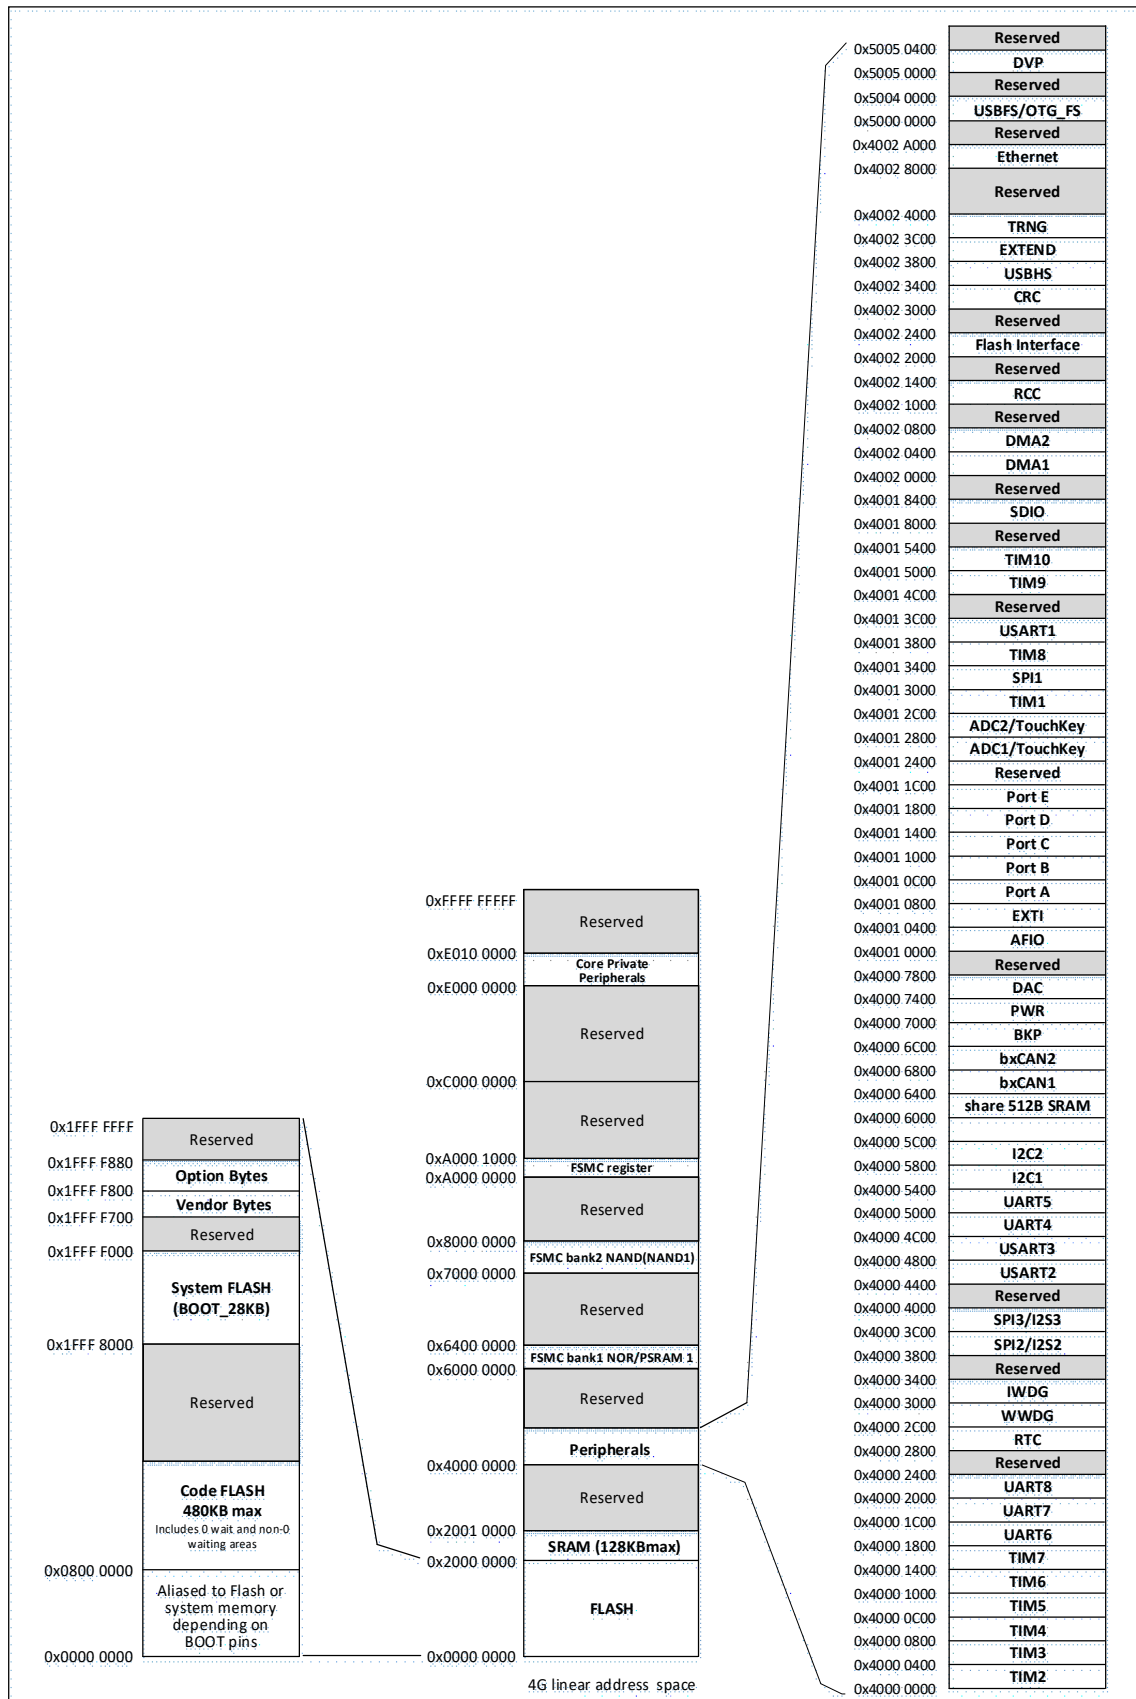

Figure 2-1-2 CH32V317 System block diagram

## 2.3 Memory Map

Figure 2-2 Memory address map

## 2.4 Clock Tree

Four groups of clock sources are introduced into the system: internal high-frequency RC oscillator (HSI), internal low-frequency RC oscillator (LSI), external high-frequency oscillator (HSE), and external low-frequency oscillator (LSE). Among them, the low-frequency clock source provides the clock reference for RTC and independent watchdog. The high-frequency clock source is directly or indirectly multiplied by the PLL and output as the system clock (SYSCLK). The system clock is then provided by each prescaler to provide the HB domain, PB1 domain, PB2 domain peripheral control clock and sampling or output clock. Some modules need to be directly provided by the PLL clock.

Figure 2-3 CH32V303/307/317 clock tree block diagram

Figure 2-4 CH32V303 clock tree block diagram

Note: 1. When using USB, the CPU clock speed must be 48MHz or 96MHz or 144MHz. When system wakes up from Stop mode or Standby mode, the system will automatically select HSI as the system clock frequency.

## 2.5 Functional Description

### 2.5.1 RISC-V4F Processor

RISC-V4F supports the IMAFC subset of the RISC-V instruction set with the addition of single-precision floating-point operations. The processor is managed internally in a modular fashion and contains units such as a

fast programmable interrupt controller (PFIC), memory protection, branch prediction mode, and extended instruction support. Externally multiple buses are connected to external unit modules to enable interaction between external function modules and the core.

QingKe microprocessor can be flexibly applied in different scenarios, such as small-area low-power embedded scenarios, high-performance application operating system scenarios, etc., due to its minimal instruction set, multiple working modes, and modular customization extensions.

- Support machine and user privilege mode
- Fast Programmable Interrupt Controller (FPIC)
- Multi-level hardware interrupt stack
- 2-wire Serial debug interface
- Standard memory protection design
- Static or dynamic branch prediction, efficient jump, conflict detection
- Custom extended instructions

### 2.5.2 On-chip Memory and Boot Mode

Up to 128K bytes of built-in SRAM area, used to store data, data will be lost after power failure. The specific capacity depends on the corresponding chip model.

Built-in program flash memory storage area (Code FLASH) of up to 480K bytes, i.e., user area, is used for user's application program and constant data storage. It includes a zero-wait program run area and a non-zero-wait area. The specific size of the area corresponds to the chip model.

Built-in 28K bytes System FLASH, i.e., BOOT area, is used for system boot program storage (manufacturer's cured bootloader).

128 bytes for system non-volatile configuration information storage area, for the manufacturer's configuration word storage, factory-cured, the user can not be modified.

128 bytes are used for user-defined information storage area for user option byte storage.

At startup, one of 3 boot modes can be selected through the boot pins (BOOT0 and BOOT1):

- Boot from program flash
- Boot from system memory
- Boot from internal SRAM

The bootloader is stored in the system memory, and the contents of the program Flash memory storage can be reprogrammed through the USART1 and USB interface.

### 2.5.3 Power Supply Scheme

(1) CH32V303/305/307

- $V_{DD} = 2.4^{(1)}\sim 3.6V$ : provides power to some of the I/O pins and internal voltage regulators, including built-in USB PHY and Ethernet PHY.
- $V_{IO} = 2.4^{(1)}\sim 3.6V$ : It supplies power to most of the I/O pins, which determines the pin output high voltage amplitude. Normal work during operation, the  $V_{IO}$  voltage cannot be higher than the  $V_{DD}$  voltage.
- $V_{DDA} = 2.4^{(1)}\sim 3.6V$ : It supplies power to the analog part of the high-frequency RC oscillator, ADC, temperature sensor, OPA, DAC and PLL. The  $V_{DDA}$  voltage must be the same as the  $V_{IO}$  voltage (If  $V_{DD}$  is powered down and  $V_{IO}$  is live, Then  $V_{DDA}$  must be live and consistent with  $V_{IO}$ ). When using ADC,  $V_{DDA}$  must not be less than 2.4V.
- $V_{BAT} = 1.8\sim 3.6V$ : Optional standby power supply. When  $V_{DD}$  is turned off, (through the internal power switch) independently powers the RTC, external low-frequency oscillator and backup registers.

(2) CH32V317

- $V_{DD} = 2.4^{(1)}\sim 3.6V$ : Power supply for some I/O pins and internal voltage regulators, including built-in USBPHY and Ethernet 10MPHY.
- $V_{IO} = 2.4^{(1)}\sim 3.6V$ : Most I/O pins supply power, which determines the high voltage amplitude of pin output. During normal operation, the  $V_{IO}$  voltage cannot be higher than the  $V_{DD}$  voltage.
- $V_{DDA} = 2.4^{(1)}\sim 3.6V$ : Power supply for high frequency RC oscillator, ADC, temperature sensor, OPA, DAC and analog part of PLL. The voltage of  $V_{DDA}$  must be the same as that of  $V_{IO}$  (if  $V_{DDA}$  is powered off and  $V_{IO}$  is charged,  $V_{DDA}$  must be charged and consistent with  $V_{IO}$ ). When using ADC,  $V_{DDA}$  shall not be less than 2.4V.
- $V_{DD\_ETH} = 2.4^{(1)}\sim 3.6V$ : Built-in 10/100M Ethernet PHY power supply. It is suggested to connect a capacitance of 1 UF ~ 4.7 UF to the ground, and support 10uF but need to connect 0.1uF in parallel.
- $V_{DDK}$ : The internal power supply LDO decoupling terminal needs an external decoupling capacitor with a capacity of 1uF.
- $V_{BAT} = 1.8\sim 3.6V$ : Optional backup power supply, which supplies power to RTC, external low-frequency oscillator and backup register separately (through internal power switch) when  $V_{DD}$  is turned off.

### 2.5.4 Power Supply Monitor

The product integrates a power-on reset (POR)/power-down reset (PDR) circuit, which is always in operation. When  $V_{DD}$  is lower than the set threshold ( $V_{POR/PDR}$ ), the device is reset without the need for an external reset circuit.

In addition, the system is equipped with a programmable voltage monitor (PVD), which needs to be turned on by software to compare the voltage of  $V_{DD}$  power supply with the set threshold  $V_{PVD}$ .

Turn on the corresponding edge interrupt of PVD, and you can receive interrupt notification when  $V_{DD}$  drops to the PVD threshold or rises to the PVD threshold. Refer to Chapter 4 for the values of  $V_{POR/PDR}$  and  $V_{PVD}$ .

### 2.5.5 Voltage Regulator

After reset, the regulator is automatically turned on, and there are 3 operation modes according to the application mode.

- ON mode: normal operation, providing stable core power.
- Low-power mode: When the CPU enters Stop mode, the regulator can be selected to run with low- power consumption.
- OFF mode: When the CPU enters Standby mode, it automatically switches the regulator to this mode, the voltage regulator output is in high impedance, and the core power.

The voltage regulator is always ON after reset. It is OFF in Standby mode, and the regulator output is in high impedance.

### 2.5.6 Low-power Mode

The system supports 3 low-power modes, which can be selected for low-power consumption, short start-up time and multiple wake-up events to achieve the best balance.

- Sleep mode

In Sleep mode, only the CPU clock is stopped, but all peripheral clocks are powered normally and the peripherals are in a working state. This mode is the shallowest low-power mode, but it is the fastest mode to wake-up the system.

Exit condition: any interrupt or wake-up event.

- Stop mode

In this mode, the FLASH enters low-power mode, and the PLL, HSI RC oscillator and HSE crystal oscillator are

turned off. In the case of keeping the contents of SRAM and registers not lost, the Stop mode can achieve the lowest power consumption.

Exit conditions: any external interrupt/event (EXTI signal), external reset signal on NRST, IWDG reset, among which EXTI signal includes one of 16 external I/O ports, PVD output, RTC alarm clock, Ethernet wake-up signal or USB wake-up signal.

- Standby mode

In this mode, the main LDO of the system is turned off, the low-power LDO supplies power to the wake-up circuit, all other digital circuits are powered off, and the FLASH is powered off. The system wakes up from Standby mode will generate a reset, and SBF (PWR\_CSR) will be set at the same time. After waking up, check the SBF status to know the low-power mode before waking up. SBF is cleared by the CSBF (PWR\_CR) bit. In the Standby mode, the contents of 32KB of SRAM can be kept (depending on the planning and configuration before going to bed), and the contents of the backup registers are kept.

Exit conditions: any external interrupt/event (EXTI signal), external reset signal on NRST, IWDG reset, a rising edge on the WKUP pin, where EXTI signal includes one of 16 external I/O ports, RTC alarm clock, Ethernet Wake-up signal, USB.

### 2.5.7 CRC (Cyclic Redundancy Check) Calculation Unit

The CRC (cyclic redundancy check) calculation unit uses a fixed polynomial generator to generate a CRC code from a 32-bit data word. In many applications, CRC-based technology is used to verify the consistency of data transmission or storage. Within the scope of the EN/IEC 60335-1 standard, a means of detecting flash errors is provided. The CRC calculation unit can be used to calculate the signature of the software in real time and compare it with the signature generated when the software is linked and generated.

### 2.5.8 Fast Programmable Interrupt Controller (FPIC)

The product has a built-in Fast Programmable Interrupt Controller (FPIC), which supports up to 255 interrupt vectors, and provides flexible interrupt management functions with minimal interrupt latency. The current product manages 8 core private interrupts and 88 peripheral interrupt management, and other interrupt sources are reserved. FPIC registers can be accessed in user and machine privileged modes.

- 2 individual maskable interrupts
- A non-maskable interrupt NMI
- Support hardware interrupt stack (HPE) without instruction overhead
- 4-channel vector table free interrupts (VTF)
- Vector table supports address or command mode
- Configurable interrupt nesting depth, up to 8 levels
- Support interrupt tail-chaining

### 2.5.9 External Interrupt/Event Controller (EXTI)

The external interrupt/event controller contains a total of 19 edge detectors for generating interrupt/event requests. Each interrupt line can independently configure its trigger event (rising edge or falling edge or both edges), and can be individually masked; the suspend register maintains all interrupt request states. EXTI can detect that the pulse width is smaller than the clock period of the internal PB2. Up to 80 general-purpose I/O ports can be connected to 16 external interrupt lines.

### 2.5.10 General DMA Controller

The system has built-in 2 groups of general-purpose DMA controllers, manages 18 channels in total, and flexibly handles high-speed data transmission from memory to memory, peripherals to memory, and memory to

peripherals, and supports ring buffer mode. Each channel has a dedicated hardware DMA request logic to support one or more peripherals' access requests to the memory. The access priority, transfer length, source address and destination address of the transfer can be configured.

The main peripherals used by DMA include: general/advanced/basic timers TIMx, ADC, DAC, I<sup>2</sup>S, USART, I<sup>2</sup>C, SPI, and SDIO.

*Note: DMA1, DMA2 and CPU access the system SRAM after arbitration by the arbiter.*

### 2.5.11 Clock and Boot

The system clock source HSI is turned on by default. After the clock is not configured or reset, the internal 8MHz RC oscillator is used as the default CPU clock, and then an external 3~25MHz clock or PLL clock can be additionally selected. When the clock security mode is turned on, if the HSE is used as the system clock (directly or indirectly), the system clock will automatically switch to the internal RC oscillator when the external clock is detected to be invalid, and the HSE and PLL will be automatically turned off at the same time; in low-power consumption mode, the system will automatically switch to the internal RC oscillator after waking up. If the clock interrupt is enabled, the software can receive the corresponding interrupt.

Multiple prescalers are used to configure the frequency of HB. The high-speed PB (PB2) and low-speed PB (PB1) regions provide peripheral clocks with a maximum frequency of 144MHz. Refer to the clock tree block diagram in Figure 2-3. The clock source of the I2S unit is another dedicated PLL (PLL3), so that the I<sup>2</sup>S master clock can generate all standard sampling frequencies between 8kHz and 192kHz.

### 2.5.12 Real Time Clock (RTC) and Backup Registers

The RTC and the backup register are in the backup power supply area inside the system. When V<sub>DD</sub> is valid, it is powered by V<sub>DD</sub>, and when V<sub>DD</sub> is invalid, the internal power is automatically switched to the V<sub>BAT</sub> pin.

The RTC real-time clock is a set of 32-bit programmable counters, and the time base supports 20-bit prescaler for measurement in a longer period of time. The clock reference source is a high-speed external clock divided by 128 (HSE/128), external crystal low-frequency oscillator (LSE) or internal low-power RC oscillator (LSI). The LSE also has a backup power supply area, so when the LSE is selected as the RTC time base, the RTC setting and time can remain unchanged after the system resets or wakes up from Standby mode.

The backup register contains up to 42 16-bit registers, which can be used to store 84 bytes of user application data. This data can continue to be maintained after wake-up from Standby, or system Reset or power Reset. When the intrusion detection function is turned on, once the intrusion detection signal is valid, all contents in the backup register will be cleared.

### 2.5.13 Analog-to-digital Converter (ADC) and Touch Key Capacitance Detection (TKey)

The product has built-in 2 12-bit analog/digital converters (ADC), sharing up to 16 external channels and 2 internal channels for sampling. The programmable channel sampling time can realize single, continuous, scanning or discontinuous conversion. And supports dual ADC conversion mode. The analog watchdog function is provided to allow very precise monitoring of one or more selected channels for monitoring the signal voltage of the channel. It supports external event-triggered conversion, the trigger source includes the internal signal and external pin of the on-chip timer; it also supports the use of DMA operations.

ADC internal channel sampling includes 1 channel of built-in temperature sensor sampling and 1 channel of internal reference power sampling. The temperature sensor generates a voltage that varies linearly with temperature. The temperature sensor is internally connected to the IN16 input channel, which is used to convert

the output of the sensor to a digital value.

The touch button capacitance detection unit provides up to 16 detection channels and reuses the external channels of the ADC module. The test results are converted into output results by the ADC module, and the touch button state is identified by software calculation.

### 2.5.14 Digital-to-analog Converter (DAC)

The product has 2 built-in 12-bit voltage output digital / analog converters (DAC), which converts 2 digital signals into 2 analog voltage signals and outputs. It supports dual DAC channels independent or synchronous conversion, and supports external event trigger conversion. The trigger source includes the internal signal of the on-chip timer and the external pin (EXTI line 9). Triangular wave and noise generation can be realized. Support the use of DMA operations.

### 2.5.15 Timer and Watchdog

The timers in the system include advanced timers, general timers, basic timers, watchdog timers, and system time base timers. The number of timers included in different products in the series is different, please refer to Table 2-2 for details.

Table 2-2 Timer comparison

Timer		Resolution	Count Type	Time Base	DMA	Function
Advanced control timer	TIM1	16 bits	Up Down Up/down	PB2 time domain 16-bit divider	Supported	PWM complementary output, single pulse output Input capture Output compare Timer count
	TIM8					
	TIM9					
	TIM10					
General-purpose timer	TIM2	16 bits	Up Down Up/down	PB1 time domain 16-bit divider	Supported	Input capture Output compare Timer count
	TIM3					
	TIM4					
	TIM5					
Basic timer	TIM6	16 bits	Up	PB1 time domain 16-bit divider	Supported	Timing count
	TIM7					
Window watchdog		7 bits	Down	PB1 time domain 4 types of frequency division	Not supported	Timing Reset the system (normal work)
Independent watchdog		12 bits	Down	PB1 time domain 7 types of frequency division	Not supported	Timing Reset the system (normal work + low-power work)
SysTick timer		64 bits	Up/down	SYSCLK or SYSCLK/8	Not supported	Timing

- Advanced-control timer

The advanced control timer is a 16-bit auto-loading up/down counter with a 16-bit programmable prescaler. In addition to the complete general-purpose timer function, it can be regarded as a three-phase PWM generator distributed to 6 channels, with a complementary PWM output function with dead zone insertion, allowing the timer to be updated after a specified number of counter cycles to repeat counting cycle, braking function, etc. Many functions of the advanced control timer are the same as the general timer, and the internal structure is also the same. Therefore, the advanced control timer can cooperate with other TIM timers through the timer link function to provide synchronization or event link functions.

- General-purpose timer

The general timer is a 16-bit auto-loading up/down counter with a programmable 16-bit prescaler and 4 independent channels. Each channel supports input capture, output comparison, and PWM generation and single pulse mode output. It can also work with advanced control timers through the timer link function to provide synchronization or event link functions. In Debug mode, the counter can be frozen while the PWM outputs are disabled, thereby cutting off the switches controlled by these outputs. Any general-purpose timer can be used to generate PWM output. Each timer has an independent DMA request mechanism. These timers can also process signals from incremental encoders, as well as digital outputs from 1 to 3 Hall sensors.

- Basic timer

The basic timer is a 16-bit auto-load counter that supports a 16-bit programmable prescaler. Digital-to-analog conversion (DAC) can provide a clock and trigger the synchronization circuit of the DAC. The basic timers are independent of each other and do not share any resources with each other.

- Independent watchdog

The independent watchdog is a configurable 12-bit down counter that supports 7 frequency division factors. The clock is provided by an internal independent about 40kHz RC oscillator (LSI); because the LSI is independent of the main clock, it can run in Stop and Standby modes. IWDG is outside the main program and can work completely independently. Therefore, it is used to reset the entire system when a problem occurs, or as a free timer to provide timeout management for the application. It can be configured as software or hardware to start the watchdog through the option byte. In Debug mode, the counter can be frozen.

- Window watchdog

The window watchdog is a 7-bit down counter and can be set to free-running. It can be used to reset the entire system when a problem occurs. It is driven by the main clock and has an early warning interrupt function; in Debug mode, the counter can be frozen.

- SysTick timer

QingKe microprocessor core comes with a 64-bit optional increasing or decreasing counter, which is used to generate SYSTICK exceptions (exception number: 15). It can be specially used in real-time operating systems to provide "heartbeat" rhythm for the system, and can also be used as a standard 64-bit counter. It has automatic reload function and programmable clock source.

### 2.5.16 Universal Synchronous/Asynchronous Receiver Transmitter (USART)

The product provides 3 groups of Universal Synchronous/Asynchronous Receiver Transmitters (USART1, USART2, USART3), and 5 groups of Universal Asynchronous Receiver Transmitters (UART4, UART5, UART6, UART7, UART8). It supports full-duplex asynchronous communication, synchronous one-way communication and half-duplex single-wire communication. It also supports LIN (Local Interconnect Network), compatible with

ISO7816 smart card protocol and IrDA SIR ENDEC transmission codec specification, and modem (CTS/RTS hardware flow control) operation. It also allows multi-processor communication. It uses a fractional baud rate generator system and supports DMA operation continuous communication.

### 2.5.17 Serial Peripheral Interface (SPI)

Up to 3 groups of serial peripherals interface (SPI) provide master or slave operation, dynamic switching. Support multi-master mode, full-duplex or half-duplex synchronous transmission, support basic SD card and MMC mode. Programmable clock polarity and phase, data bit width provides 8 or 16-bit selection, hardware CRC generation/check for reliable communication, and continuous communication support for DMA operation.

### 2.5.18 I2S (audio) Interface

Up to 2 sets of standard I2S interfaces (multiplexed with SPI2 and SPI3) operate in master or slave mode. The software can be configured to transmit frames with 16/32-bit packets, support audio sampling frequencies from 8kHz to 562.2kHz, and support four audio standards. In main mode, the master clock can be output to external DAC or CODEC (decoder) at a fixed audio sampling frequency of 256x, and DMA is supported.

### 2.5.19 I2C Bus

Up to 2 I2C bus interfaces can work in multi-master mode or Slave mode, perform all I2C Bus specific timing, protocol, arbitration, etc. It supports both standard and fast speed, and is compatible with SMBus2.0.

The I2C interface provides 7-bit or 10-bit addressing, and supports dual slave addressing in 7-bit Slave mode. It integrates built-in hardware CRC generator/checker. It also supports DMA operation and supports SMBus bus version 2.0 / PMBus bus.

### 2.5.20 Controller Area Network (CAN)

The CAN interface is compatible with specifications 2.0A and 2.0B (active), the baud rate is up to 1Mbits/s, and it supports time-triggered communication functions. It can receive and send standard frames with 11-bit identifiers, as well as extended frames with 29-bit identifiers. It has 3 sending mailboxes and 2 3-level deep receiving FIFOs.

Products with 2 CAN controllers share 28 configurable filters and 512 bytes of SRAM memory resources.

With 1 set of CAN controller products, there are only 14 configurable filters, and share a dedicated 512-byte SRAM memory with the USB module for data transmission and reception. When USB and CAN are used at the same time, in order to prevent access to SRAM conflicts, USB can only use the lower 384 bytes.

### 2.5.21 Universal Serial Bus USB2.0 Full-speed Host/Device Controller (USBFS/OTG\_FS)

USB2.0 full-speed host controller and device controller (USBFS) follow the USB2.0 full-speed standard. It provides 16 configurable USB device endpoints and a set of host endpoints. Support control/batch/synchronization/interrupt transmission, double buffer mechanism, USB bus suspend/resume operation, and provide standby/wake-up functions. The 48MHz clock dedicated to the USBFS module is directly generated by the internal main PLL frequency division (the PLL must be 144MHz or 96MHz or 48MHz).

OTG\_FS is a dual role USB controller that supports both host-side and device-side functionality and is compatible with the On-The-Go Supplement to the USB2.0 specification. The controller can also be configured as a host-side only or device-side only controller, compatible with the USB2.0 Full Speed specification. The controller uses a 48MHz clock derived from PLL divider and key features include

- Support the USB On-The-Go Supplement (physical layer of the OTG\_FS controller), defined as an optional OTG protocol in the Revision 1.3 specification
- Software configurable USB full speed host, USB full speed/low speed device, USB dual role device
- Provide power saving function

- Support control transfer, bulk transfer, interrupt transfer, real-time/synchronous transfer
- Provide bus reset, suspend, wakeup and resume functions

### 2.5.22 Universal Serial Bus USB2.0 High-speed Host/Device Controller (USBHS)

USB2.0 high-speed controller has dual roles of host controller and device controller, and has built-in USB-PHY physical layer transceiver of 480Mbps. When used as a host controller, it can support low-speed, full-speed and high-speed USB devices. When used as a device controller, it can be flexibly set to low-speed, full-speed or high-speed mode to adapt to a variety of applications. Key features include:

- Support USB 2.0, USB 1.1, USB 1.0 protocol specifications
- Support control transfer, bulk transfer, interrupt transfer, real-time/synchronous transfer
- Provide bus reset, suspend, wakeup and resume functions
- Support high-speed HUB
- Provide 16 groups of up and down transmission channels in device mode, supports configuration of 16 endpoint numbers
- All endpoints except device endpoint 0 support packets up to 1024 bytes, with double buffering available

### 2.5.23 Digital Video Port (DVP)

Digital Video Port (DVP) is used to connect to the camera module to obtain the image data stream. It provides 8/10/12bit parallel interface way of communication. It supports image data organized in original line and frame formats, such as YUV, RGB, etc., and also supports compressed image data streams such as JPEG format. When receiving, it mainly relies on VSYNC and HSYNC signal synchronization. Support image cropping function.

### 2.5.24 SDIO Host Controller

The SDIO host interface provides interfaces for the operation of multimedia cards (MMC), SD memory cards, SDIO cards, and CE-ATA devices. Three different data bus modes are supported: 1-bit (default), 4-bit and 8-bit. In 8-bit mode, the interface enables data transfer rates up to 48 MHz. currently the interface is fully compatible with the Multimedia Card System Specification 4.2 (forward compatible), SD I/O Card Specification 2.0, SD Memory Card Specification 2.0, and CE-ATA Digital Protocol Specification 1.1.

### 2.5.25 Flexible Static Memory Controller

The FSMC interface provides mainly synchronous or asynchronous memory interfaces, supporting SRAM, PSRAM, NOR and NAND devices. The internal HB transfer signal is converted to a suitable external communication protocol, allowing continuous access to 8/16/32 bit data. The sampling delay time is flexibly configurable to suit different device timings.

In addition, the FSMC can also be used to interface with most graphic LCD controllers. It supports the Intel 8080 and Motorola 6800 models, making it easy to build simple graphic application environments or high-performance solutions for dedicated accelerated controllers.

### 2.5.26 Gigabit Ethernet controller (MAC+PHY)

The product provides an IEEE802.3-2002 compliant Gigabit Ethernet controller (MAC), which acts as the data link layer. Its Link rate supports 1Gbps at the highest speed, supports gigabit and 100 megabit and speed adaptation, and provides a MII/RMII/RGMII interface to connect to external PHY chips (such as 100Mbps's industrial physical layer chip CH182). In application, combined with TCP/IP protocol stack to achieve the development of network products.

CH32V307 chip has built-in 10Mbps Ethernet PHY physical layer transceiver; The CH32V317 chip has a built-in 10Mbps/100Mbps Ethernet PHY physical layer transceiver. Ethernet communication can be realized on a

single chip.

Key features include:

- Compliant with IEEE 802.3 protocol specification and design
- Provide RGMII, RMII, MII interfaces to external Ethernet PHY transceivers
- Support full-duplex operation and 10/100/1000Mbps data transfer rates
- Hardware automatic IPv4 and IPv6 packet integrity checks, IP/ICMP/UDP/TCP packet checks and computer frame length padding
- Multiple MAC address filtering modes
- External PHY can be configured and managed by SMI
- The application of CH32V307 chip can choose Ethernet controller MAC+built-in 10Mbps PHY or external 1Gbps PHY.
- The chip application of CH32V317 can be built-in 10Mbps/100Mbps PHY for Ethernet controller MAC+.

### 2.5.27 General-purpose Input and Output (GPIO)

The system provides 5 groups of GPIO ports with a total of 80 GPIO pins. Each pin can be configured by software as output (push-pull or open-drain), input (with or without pull-up or pull-down) or multiplexed peripheral function port. Most GPIO pins are shared with digital or analog multiplexed peripherals. Except for ports with analog input functions, all GPIO pins have high current passing capabilities. A locking mechanism is provided to freeze the IO configuration to avoid accidental writing to the I/O register.

Most of the IO pins in the system are provided by  $V_{IO}$ . Changing the  $V_{IO}$  power supply will change the high value of the IO pin output level to adapt to the external communication interface level. Please refer to the pin description for specific pins.

### 2.5.28 Random Number Generator (RNG)

The product has built-in a random number generator, which provides a 32-bit random number through the internal analog circuit.

### 2.5.29 Operational Amplifier/Comparator (OPA)

The product has 4 sets of operational amplifiers, which can also be used for comparators. The internal selection is associated with ADC and TIMx peripherals, whose inputs and outputs can be selected for multiple channels by changing the configuration. Support the external analog small signal to be amplified into ADC to achieve small signal ADC conversion, can also complete the signal comparator function, the comparison results are output by GPIO or directly connected to the input channel of TIMx.

### 2.5.30 2-wire SDI Serial Debug Interface

The core comes with a 2-wire serial debug interface (SDI), including SWDIO and SWCLK pins. The default debug interface pin function is turned on after the system is powered on or reset, and the SDI can be turned off according to the need after the main program is running.

# Chapter 3 Pinouts and Pin Definition

## 3.1 Pinouts

### 3.1.1 Interconnectivity Device V307

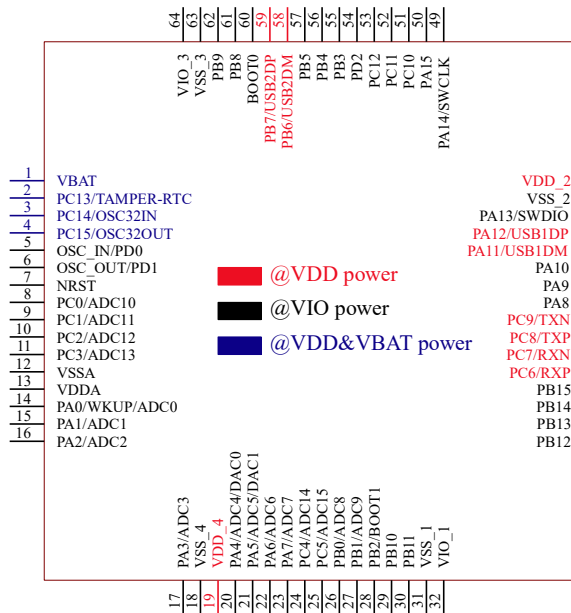

CH32V307VCT6

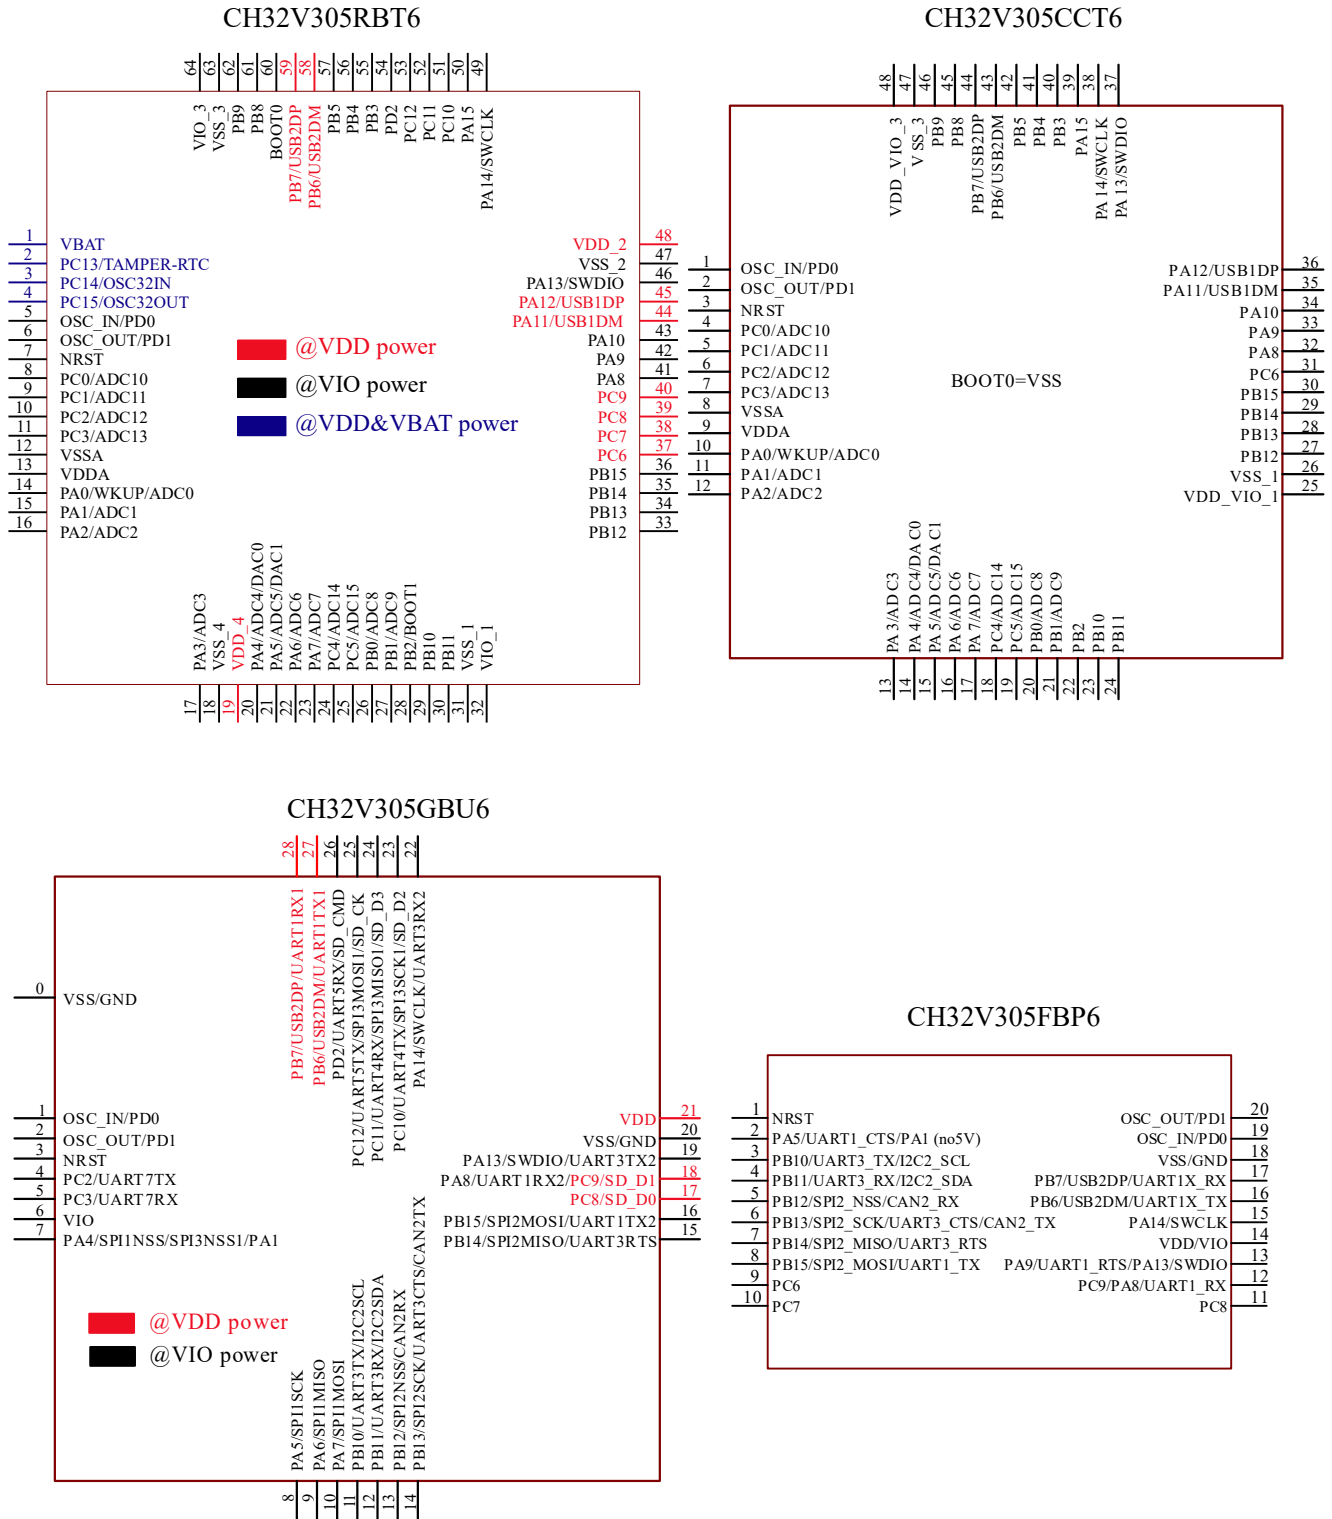

CH32V307WCU6

CH32V307RCT6

### 3.1.2 Connectivity Device V305

### 3.1.3 High-capacity General-purpose Device V303

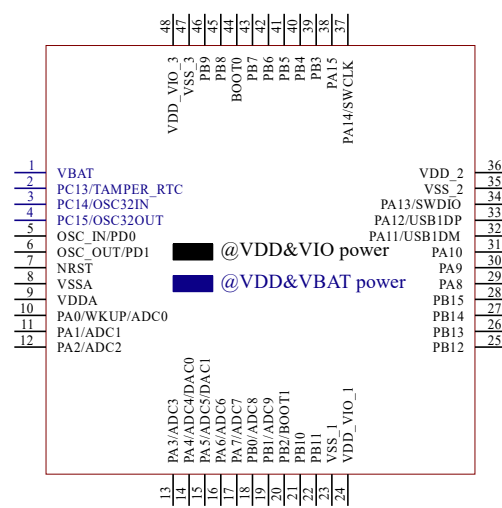

CH32V303VCT6

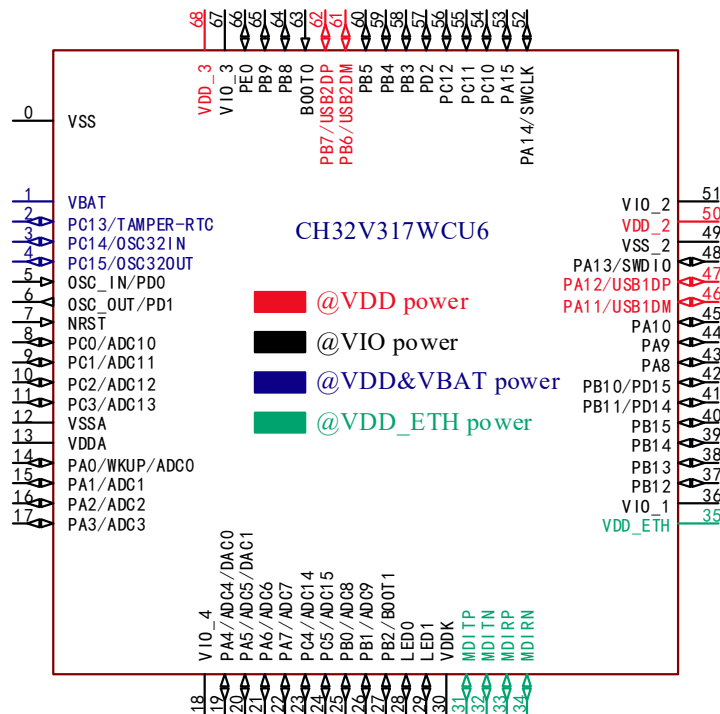

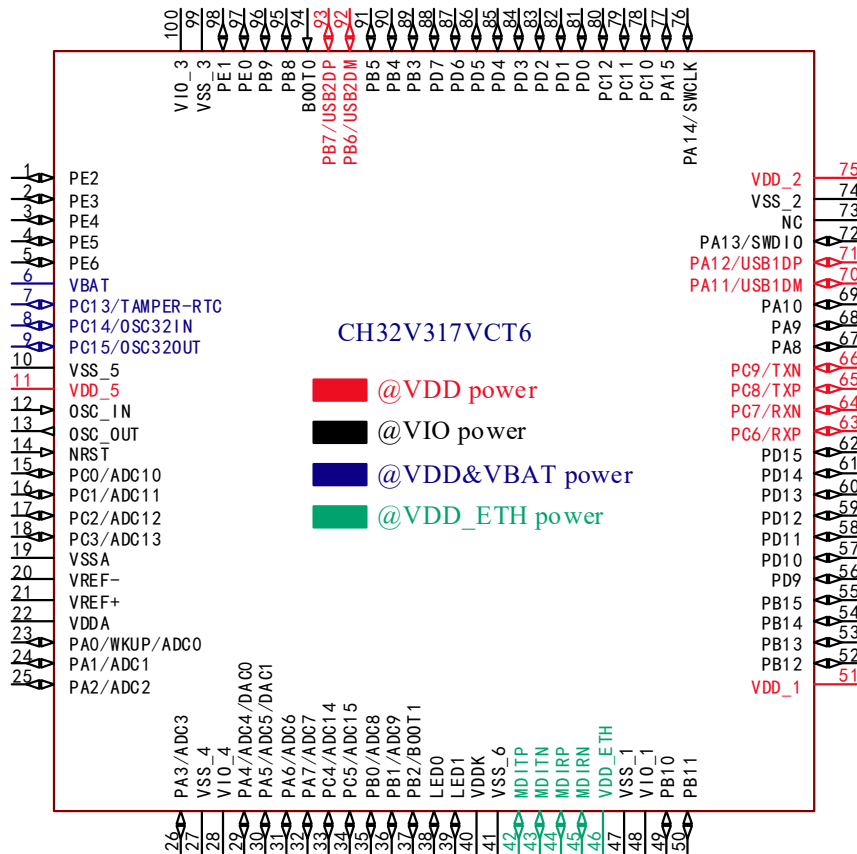

CH32V303RKT6

CH32V303CBT6

### 3.1.4 Interconnectivity Device V317

### 3.2 Pin Definitions

Note: The pin function in the table below refer to all functions and does not involve specific model(s). There are differences in peripheral resources between different models. Please confirm whether this function is available according to the particular model's resource table before viewing this table.

Table 3-1 CH32V303/305/307 pin definitions

Note 1: Abbreviations in the table

*I* = TTL/CMOS Schmitt input;

*O* = CMOS tri-state output;

*A* = analog signal input or output;

*P* = power;

*FT* = 5V tolerance;

*ANT* = RF signal input and output (antenna).

Note 2: Both  $V_{DD}$  and  $V_{BAT}$  can be connected with an internal analog switch to supply power to the backup area and the pins PC13, PC14 and PC15. This analog switch can only pass a limited current (3mA). When powered by  $V_{DD}$ , PC14 and PC15 can be used for GPIO or LSE pins, and PC13 can be used as a general-purpose I/O port, TAMPER pin, RTC calibration clock, RTC alarm clock or second output; PC13, PC14 and PC15 can only work in 2MHz mode when they are used as GPIO output pins, and the maximum driving load is 30pF, and they cannot be used as current sources (such as driving LEDs). When the power is supplied by  $V_{BAT}$ , PC14 and PC15 can only be used for LSE pin, and PC13 can be used as TAMPER pin, RTC alarm clock or second output.

Note 3: These pins are in the main function state when the backup area is powered on for the first time. Even after reset, the state of these pins is controlled by the backup area registers (these registers will not be reset by the main reset system). For specific information on how to control these I/O ports, please refer to the relevant chapters on the battery backup area and BKP register in the CH32FV2x\_V3xRM datasheet.

Note 4: Pin 5 and pin 6 of those in LQFP64M package are configured as OSC\_IN and OSC\_OUT function pins by default after chip reset. Software can reconfigure these 2 pins as PD0 and PD1. But for those in LQFP100 package, since PD0 and PD1 are inherent functional pins, there is no need to remap settings by software. For more detailed information, please refer to the chapters on Alternate Function I/O and Debug Setting in the CH32FV2x\_V3xRM datasheet.

Note 5: For devices without the BOOT0 pinout, they are pulled down to GND internally. For devices with the BOOT0 pinout but no BOOT1/PB2 pinout, BOOT1/PB2 is pulled down to GND internally. In this case, it is recommended that the BOOT1/PB2 pinout is set to input pull-down mode if a device goes into the low-power mode and configures I/O port state, to avoid generating extra current.

Note 6: For CH32V305FBP6 and CH32V305GBU6 chips, the PA8 and PC9 pins are shorted inside the chip, it is prohibited to configure both IOs as output functions, pay attention to the pin state if there are power consumption requirements.

Note 7: SDIO\_D0 and SDIO\_D1 are mapped to PC8 and PC9 by default. Only for products with the fifth from the bottom of the batch number greater than 1 or the sixth from the bottom of the lot number not equal to 0 (except for the chip CH32V305GBU6), when the bit[14]ETHMACEN=1 and bit[10]SDIOEN=1 in the register RCC\_AHBPCENR, the default mapping of SDIO\_D0 and SDIO\_D1 is automatically changed to PB14 and PB15.

Note 8: DVP\_D5 is mapped to PB6 by default. Only for products with the fifth from the bottom of the lot number greater than 1 or the sixth from the bottom of the batch number not equal to 0, when the bit[13]DVPEN=1 and bit[11]USBHSEN=1 in the register RCC\_AHBPCENR and the bit[2]RB\_UC\_RST\_SIE=0 in R8\_USB\_CTRL, the default mapping of DVP\_D5 is automatically changed to PB3.

Note 9: FSMC\_NADV is mapped to PB7 by default. Only for products with the fifth from the bottom of the lot number greater than 1 or the sixth from the bottom of the lot number not equal to 0, when the bit[8]FSMCEN=1 and bit[11]USBHSEN=1 in the register RCC\_AHBPCENR and bit[2]RB\_UC\_RST\_SIE=0 in R8\_USB\_CTRL, the default mapping of FSMC\_NADV will be automatically changed to.

Note 10: I2S3\_SD is mapped to PB5 by default. Only for products with the fifth from the bottom of the lot number greater than 2 or the sixth last digit of the lot number not equal to 0, if 10M Ethernet and I2S3 functions are used at the same time, the default mapping of I2S3\_SD will be automatically changed to PA9.

Note 11: I2S3\_MCK is mapped to PC7 by default. Only for products with the fifth from the bottom of the lot number greater than 2 or the sixth last digit of the lot number not equal to 0, if 10M Ethernet and I2S3 functions are used at the same time, the default mapping of I2S3\_MCK will be automatically changed to PA8.

Note 12: SPI3\_MOSI is mapped to PB5 by default. Only for products with the fifth from the bottom of the lot number equal to 2 or the sixth last digit of the lot number equal to 0, when using Ethernet, the default pin function of I2S3 is not available, and the chip selection signal of the default pin of SPI3 is not available. At this time, the default mapping of SPI3\_MOSI is automatically changed to PA15.

Note 13: The value after the underscore of the remap function indicates the configuration value of the corresponding bit in the AFIO register. For example, UART4\_RX\_3 indicates that the corresponding bit in the AFIO register is configured as 11b.

Note 14: TIM2\_CH1 and TIM2\_ETR share a common pin, but cannot be used at the same time.

Note 15 and Note 16: For CH32V305FBP6 chip, PA5 and PA1 pins are short-circuited inside the chip, prohibiting both IOs to be configured as output function; PA9 and PA13 pins are short-circuited inside the chip, prohibiting both IOs to be configured as output function; pay attention to the pin status if there is power consumption requirement.

Table 3-2 CH32V317 pin definitions

Pin No.		Pin name	Pin type <sup>(1)</sup>	I/O level	Main function (after reset)	Default alternate function	Remapping function <sup>(13)</sup>

68	-	V <sub>DD_3</sub>	P	-	V <sub>DD_3</sub>		

Note 1: Abbreviations in the table

I = TTL/CMOS Schmitt input;

O = CMOS tri-state output;

A = analog signal input or output;

P = power;

FT = 5V tolerance;

Note 2: Both V<sub>DD</sub> and V<sub>BAT</sub> can be connected with an internal analog switch to supply power to the backup area and the pins PC13, PC14 and PC15. This analog switch can only pass a limited current (3mA). When powered by V<sub>DD</sub>, PC14 and PC15 can be used for GPIO or LSE pins, and PC13 can be used as a general-purpose I/O port, TAMPER pin, RTC calibration clock, RTC alarm clock or second output; PC13, PC14 and PC15 can only work in 2MHz mode when they are used as GPIO output pins, and the maximum driving load is 30pF, and they cannot be used as current sources (such as driving LEDs). When the power is supplied by V<sub>BAT</sub>, PC14 and PC15 can only be used for LSE pin, and PC13 can be used as TAMPER pin, RTC alarm clock or second output.

Note 3: These pins are in the main function state when the backup area is powered on for the first time. Even after reset, the state of these pins is controlled by the backup area registers (these registers will not be reset by the main reset system). For specific information on how to control these I/O ports, please refer to the relevant chapters on the battery backup area and BKP register in the CH32FV2x\_V3xRM datasheet.

Note 4: For CH32V317WCU6 chip, pin 5 and pin 6 are configured as OSC\_IN and OSC\_OUT function pins by default after the chip is reset. Software can reset these two pins to PD0 and PD1 functions. However, for CH32V317VCT6 chip, because PD0 and PD1 are inherent function pins, there is no need for remapping settings by software. For more details, please refer to the reuse function I/O chapter and debugging setting chapter in the CH32FV2x\_V3xRM.

Note 5: The chip with the BOOT0 pin not led out will be pulled down to GND internally. At this time, if the IO

port is configured in low power mode, it is suggested that the input pull-down mode be used for the BOOT1/PB2 pin to prevent additional current.

Note 6, note 7: For CH32V317WCU6 chip, the pins PB10 and PD15 are short sealed inside the chip, and it is forbidden to configure both IO as output function, so pay attention to the pin state with power consumption requirements; PB11 and PD14 pins are short-sealed inside the chip, so it is forbidden to configure both IO as output function. Please pay attention to the pin status if there is power consumption requirement.

Note 8: SDIO\_D0 and SDIO\_D1 are mapped to PC8 and PC9 by default. When bit[14]ETHMACEN=1 and bit[10]SDIOEN=1 in register RCC\_AHBPCENR, the default mapping of SDIO\_D0 and SDIO\_D1 is automatically changed to PB14 and PB15.

Note 9: DVP\_D5 is mapped to PB6 by default. When bit[13]DVPEN=1 and bit[11]USBHSEN=1 in register RCC\_AHBPCENR and bit[2]RB\_UC\_RST\_SIE=0 in R8\_USB\_CTRL, the default mapping of DVP\_D5 is automatically changed to PB3.

Note 10: The value underlined by the remapping function indicates the configuration value of the corresponding bit in the AFIO register. For example, UART4\_RX\_3 indicates that the corresponding bit of AFIO register is configured as 11b.

Note 11: TIM2\_CH1 and TIM2\_ETR share a pin, but they cannot be used at the same time.

Table 3-3 CH32V317 proprietary pin description

Pin name	Pin description									
V <sub>DD_ETH</sub>	To supply power to the 10/100M Ethernet PHY, it is suggested that the capacitance between 1uF and 4.7uF should be placed close to the chip, which supports 10uF but needs to be connected in parallel with 0.1uF.									
V <sub>DDK</sub>	The external 1uF capacitor to ground is placed close to the chip.									
MDITP	Differential output in 10BASE-T/100BASE-TX MDI mode;									
MDITN	Differential input in 10BASE-T/100BASE-TX MDIX mode.									
MDIRP	Differential input in 10BASE-T/100BASE-TX MDI mode;									
MDIRN	Differential output in 10BASE-T/100BASE-TX MDIX mode.									
LED0	Traditional LED function selection, the default LED_SEL is 11:

### 3.3 Pin Alternate Functions

Note: The pin function in the table below refer to all functions and does not involve specific model(s). There are differences in peripheral resources between different models. Please confirm whether this function is available according to the particular model's resource table before viewing this table.

## Chapter 4 Electrical Characteristics

### 4.1 Test Conditions

Unless otherwise specified and marked, all voltages are referenced to  $V_{SS}$ .

All minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and clock frequency.

The typical values of CH32V303/305/307 are based on the ambient temperature of 25°C and  $V_{DD} = 3.3V$  for design guidance.

The typical value of CH32V317 is based on the ambient temperature of 25°C,  $V_{DD} = 3.3V$  and  $V_{DD\_ETH} = 3.3V$  for design guidance.

The data based on comprehensive evaluation, design simulation or technology characteristics are not tested in production. On the basis of comprehensive evaluation, the minimum and maximum values refer to sample tests. Unless otherwise specified that is tested, the characteristic parameters are guaranteed by comprehensive evaluation or design.

Power supply scheme:

Figure 4-1-1 CH32V303/305/307 typical circuit for conventional power supply

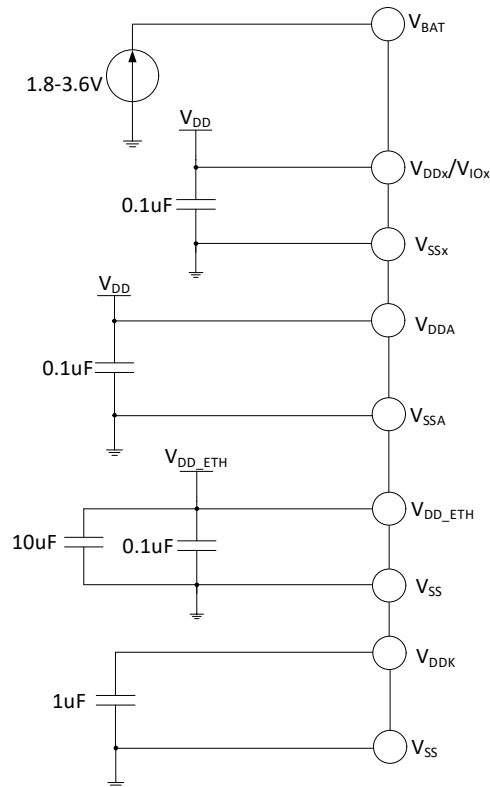

Figure 4-1-2 CH32V317 typical circuit for conventional power supply

### 4.2 Absolute Maximum Ratings

Stresses at or above the absolute maximum ratings listed in the table below may cause permanent damage to the device.

Table 4-1 Absolute maximum ratings

Symbol	Description	Min.	Max.	Unit	
T <sub>A</sub>	Ambient temperature during operation	-40	85	°C	
T <sub>S</sub>	Ambient temperature during storage	-40	125	°C	
V <sub>DD</sub> -V <sub>SS</sub>	External main supply voltage (including V <sub>DDA</sub> and V <sub>DD</sub> )	-0.3	4.0	V	
V <sub>IO</sub> -V <sub>SS</sub>	I/O supply voltage	-0.3	4.0	V	
V <sub>DD_ETH</sub> -V <sub>SS</sub>	Internal 10/100M Ethernet PHY supply voltage	CH32V317	-0.3	4.0	V
V <sub>DDK</sub>	Voltage at decoupling end of internal power supply LDO	CH32V317	-0.2	1.5	V
V <sub>IN</sub>	Input voltage on the FT (5V tolerance) pin	V <sub>SS</sub> -0.3	5.5	V	
	10/100M Ethernet PHY differential pin	V <sub>SS</sub> -0.3	V <sub>DD_ETH</sub> +0.3	V	
	Input voltage on PHY pin of USB and 10M Ethernet	V <sub>SS</sub> -0.3	V <sub>DD</sub> +0.3	V	
	Input voltage on other pins	V <sub>SS</sub> -0.3	V <sub>IO</sub> +0.3	V	
ΔV <sub>DD_x</sub>	Variations between different main power supply pins		50	mV	
ΔV <sub>IO_x</sub>	Variations between different I/O power supply pins		50	mV	
ΔV <sub>SS_x</sub>	Variations between different ground pins		50	mV	
V <sub>ESD(HBM)</sub>	Electrostatic discharge voltage (HBM, non-contact)		4K	V	
	USB pins (PA11, PA12)		3K	V	

$I_{VDD}$	Total current into $V_{DD}/V_{DDA}/V_{IO}$ power lines (source)		150	mA
$I_{VSS}$	Total current out of $V_{SS}$ ground lines (sink)		150	
$I_{I/O}$	Sink current on any I/O and control pin		25	
	Source current on any I/O and control pin		-25	
$I_{INJ(PIN)}$	Injected current on NRST pin		+/-5	
	Injected current on HSE's OSC_IN pin and LSE's OSC_IN pin		+/-5	
	Injected current on other pins		+/-5	
$\sum I_{INJ(PIN)}$	Total injected current on all I/Os and control pins		+/-25	

## 4.3 Electrical Characteristics

### 4.3.1 Operating Conditions

Table 4-2 General operating conditions

Symbol	Parameter	Condition	Min.	Max.	Unit
$F_{HCLK}$	Internal HB clock frequency			144	MHz
$F_{PCLK1}$	Internal PB1 clock frequency			144	MHz
$F_{PCLK2}$	Internal PB2 clock frequency			144	MHz
$V_{DD}$	Standard operating voltage	USB or ETH not used.	2.4	3.6	V
		Use USB or ETH	3.0	3.6	
$V_{IO}$	Output voltage on most I/O pins	$V_{IO}$ cannot be more than $V_{DD}$	2.4	3.6	V
$V_{DDA}$	Analog operating voltage (ADC is not used)	$V_{DDA}$ must be the same as $V_{IO}$ , $V_{REF+}$ cannot be higher than $V_{DDA}$ , $V_{REF-}$ is equal to $V_{SS}$ .	2.4	3.6	V
	Analog operating voltage (ADC is used)				
$V_{DD\_ETH}$	Internal 10/100M Ethernet PHY power supply voltage	CH32V317	3.2	3.45	V
$V_{BAT}^{(1)}$	Backup operating voltage	Cannot be more than $V_{DD}$	1.8	3.6	V
$T_A$	Ambient temperature		-40	85	°C
$T_J$	Junction temperature range		-40	105	°C

Note: 1. The connection line from the battery to  $V_{BAT}$  should be as short as possible.

2. For the chip with bit  $V_{LEVEL} = 1$ ,  $V_{DD}$ ,  $V_{IO}$  and  $V_{DDA}$  support the minimum power supply voltage of 2.4 V; For the chip with bit  $V_{LEVEL} = 0$ , the minimum power supply voltage supported by  $V_{DD}$ ,  $V_{IO}$  and  $V_{DDA}$  is 1.8V; When ADC, DAC and OPA peripherals are used, the minimum supply voltage supported by  $V_{DD}$ ,  $V_{IO}$  and  $V_{DDA}$  is still 2.4V.

Table 4-3 Power-on and power-down conditions

Symbol	Parameter	Condition	Min.	Max.	Unit
$t_{VDD}$	$V_{DD}$ rise time rate		0	$\infty$	us/V
	$V_{DD}$ fall time rate		20	$\infty$	

### 4.3.2 Built-in Reset and Power Control Block Characteristics

Table 4-4-1 Reset and voltage monitor (For chips with bit VLEVEL = 1)

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$V_{PVD}^{(1)}$	Level selection of programmable voltage detector <sup>(2)</sup>	PLS[2:0] = 000 (rising edge)		2.39		V
		PLS[2:0] = 000 (falling edge)		2.31		V
		PLS[2:0] = 001 (rising edge)		2.56		V
		PLS[2:0] = 001 (falling edge)		2.48		V
		PLS[2:0] = 010 (rising edge)		2.65		V
		PLS[2:0] = 010 (falling edge)		2.57		V
		PLS[2:0] = 011 (rising edge)		2.78		V
		PLS[2:0] = 011 (falling edge)		2.69		V
		PLS[2:0] = 100 (rising edge)		2.89		V
		PLS[2:0] = 100 (falling edge)		2.81		V
		PLS[2:0] = 101 (rising edge)		3.05		V
		PLS[2:0] = 101 (falling edge)		2.96		V
		PLS[2:0] = 110 (rising edge)		3.17		V
		PLS[2:0] = 110 (falling edge)		3.08		V
		PLS[2:0] = 111 (rising edge)		3.31		V
PLS[2:0] = 111 (falling edge)		3.21		V		
$V_{PVDhyst}$	PVD hysteresis			0.08		V
$V_{POR/PDR}$	Power-on/power-down reset threshold	Rising edge		2.2		V
		Falling edge		2.2		V
$V_{PDRhyst}$	PDR hysteresis			20		mV
$t_{RSTTEMPO}$	Power on reset		24	28	30	mS
	Other resets		8	10	30	

Note: 1. Normal temperature test value.

2. For CH32V317 chip, PLS[2:0] is recommended to be configured as 110 or 111.

Table 4-4-2 Reset and voltage monitor (For chips with bit VLEVEL = 0)

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$V_{PVD}^{(1)}$	Level selection of programmable voltage detector	PLS[2:0] = 000 (rising edge)		2.19		V
		PLS[2:0] = 000 (falling edge)		2.13		V
		PLS[2:0] = 001 (rising edge)		2.33		V
		PLS[2:0] = 001 (falling edge)		2.25		V
		PLS[2:0] = 010 (rising edge)		2.39		V
		PLS[2:0] = 010 (falling edge)		2.32		V
		PLS[2:0] = 011 (rising edge)		2.48		V
		PLS[2:0] = 011 (falling edge)		2.42		V
		PLS[2:0] = 100 (rising edge)		2.57		V
		PLS[2:0] = 100 (falling edge)		2.51		V
		PLS[2:0] = 101 (rising edge)		2.69		V
		PLS[2:0] = 101 (falling edge)		2.61		V
PLS[2:0] = 110 (rising edge)		2.78		V		

		PLS[2:0] = 110 (falling edge)		2.69		V
		PLS[2:0] = 111 (rising edge)		2.88		V
		PLS[2:0] = 111 (falling edge)		2.79		V
$V_{PVDhyst}$	PVD hysteresis			0.08		V
$V_{POR/PDR}$	Power-on/power-down reset threshold	Rising edge		1.59		V
		Falling edge		1.57		V
$V_{PDRhyst}$	PDR hysteresis			20		mV
$t_{RSTTEMPO}$	Power on reset		16	28	30	mS
	Other resets		2	10	30	

Note: 1. Normal temperature test value.

### 4.3.3 Built-in Reference Voltage

Table 4-5 Embedded reference voltage

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$V_{REFINT}$	Internal reference voltage	$T_A = -40^{\circ}\text{C}\sim 85^{\circ}\text{C}$	1.17	1.2	1.23	V
$T_{S\_vrefint}$	ADC sampling time when reading the internal reference voltage				17.1	us

### 4.3.4 Supply Current Characteristics

Current consumption is a comprehensive index of a variety of parameters and factors. These parameters and factors include operating voltage, ambient temperature, I/O pin load, the software configuration of the product, the operating frequency, flip rate of the I/O pin, the location of the program in memory and the executed code, etc. The current consumption measurement method is as follows:

Figure 4-2-1 CH32V303/305/307 current consumption measurement

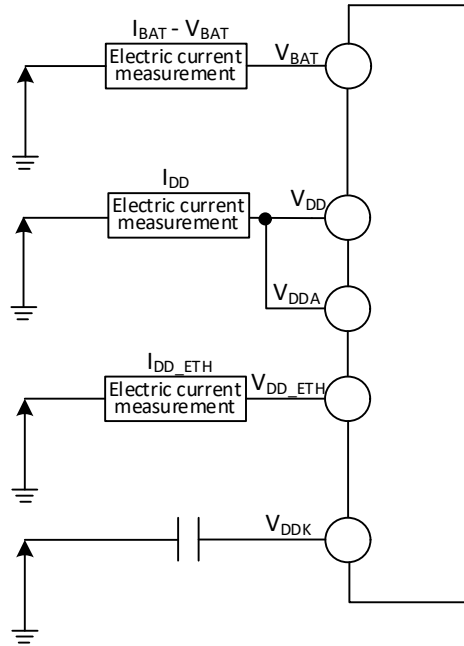

Figure 4-2-2 CH32V317 current consumption measurement

CH32V303/305/307 is in the following conditions:

Under normal temperature conditions and when  $V_{DD} = 3.3V$ , all I/O ports are configured with pull-down inputs, only one of HSE and HIS is enabled,  $HSE=8M$ ,  $HIS=8M$  (calibrated),  $F_{PLCK1}=F_{HCLK}/2$ ,  $F_{PLCK2}=F_{HCLK}$ , PLL is enabled when  $F_{HCLK}>8MHz$ . Enable or disable the power consumption of all peripheral clocks.

CH32V317 is in the following conditions:

Under normal temperature conditions and when  $V_{DD} = 3.3V$ ,  $V_{DD\_ETH} = 3.3V$  all I/O ports are configured with pull-down inputs, only one of HSE and HIS is enabled,  $HSE=8M$ ,  $HIS=8M$  (calibrated),  $F_{PLCK1}=F_{HCLK}/2$ ,  $F_{PLCK2}=F_{HCLK}$ , PLL is enabled when  $F_{HCLK}>8MHz$ . Enable or disable the power consumption of all peripheral clocks.

Table 4-6 Typical current consumption in Run mode, the data processing code runs from the internal Flash

Symbol	Parameter	Condition	Typ.		Unit	
			All peripherals enabled	All peripherals disabled		
$I_{DD}^{(1)}$	Supply current in Run mode	External clock	$F_{HCLK} = 144MHz$	22.4	12.4	mA
			$F_{HCLK} = 72MHz$	11.5	6.5	
			$F_{HCLK} = 48MHz$	8.0	4.6	
			$F_{HCLK} = 36MHz$	6.4	3.8	
			$F_{HCLK} = 24MHz$	4.4	2.7	
			$F_{HCLK} = 16MHz$	3.5	2.3	
			$F_{HCLK} = 8MHz$	1.8	1.3	
			$F_{HCLK} = 4MHz$	1.3	1.0	
			$F_{HCLK} = 500kHz$	0.8	0.7	
		Runs on the high-speed internal RC oscillator (HSI).	$F_{HCLK} = 144MHz$	22.1	12.2	
			$F_{HCLK} = 72MHz$	11.3	6.3	
$F_{HCLK} = 48MHz$	7.7		4.3			

	Uses HB prescaler to reduce the frequency.	$F_{HCLK} = 36\text{MHz}$	5.8	3.3
		$F_{HCLK} = 24\text{MHz}$	4.1	2.4
		$F_{HCLK} = 16\text{MHz}$	3.0	1.8
		$F_{HCLK} = 8\text{MHz}$	1.5	1.0
		$F_{HCLK} = 4\text{MHz}$	1.0	0.7
		$F_{HCLK} = 500\text{kHz}$	0.4	0.4

Note: The above are measured parameters.

Table 4-7 Typical current consumption in Sleep mode, data processing code runs from internal Flash or SRAM

Symbol	Parameter	Condition	Typ.		Unit	
			All peripherals enabled	All peripherals disabled		
$I_{DD}^{(1)}$	Supply current in Sleep mode (In this case, peripheral power supply and clock are maintained)	External clock	$F_{HCLK} = 144\text{MHz}$	13.7	3.8	mA
			$F_{HCLK} = 72\text{MHz}$	7.2	2.3	
			$F_{HCLK} = 48\text{MHz}$	5.1	1.8	
			$F_{HCLK} = 36\text{MHz}$	4.0	1.5	
			$F_{HCLK} = 24\text{MHz}$	2.9	1.3	
			$F_{HCLK} = 16\text{MHz}$	2.2	1.1	
			$F_{HCLK} = 8\text{MHz}$	1.4	0.8	
			$F_{HCLK} = 4\text{MHz}$	1.0	0.8	
		$F_{HCLK} = 500\text{kHz}$	0.7	0.7		
		Runs on the high-speed internal RC oscillator (HSI). Uses HB prescaler to reduce the frequency.	$F_{HCLK} = 144\text{MHz}$	13.4	3.5	
			$F_{HCLK} = 72\text{MHz}$	6.9	1.9	
			$F_{HCLK} = 48\text{MHz}$	4.7	1.4	
			$F_{HCLK} = 36\text{MHz}$	3.6	1.2	
			$F_{HCLK} = 24\text{MHz}$	2.6	0.9	
			$F_{HCLK} = 16\text{MHz}$	1.9	0.7	
			$F_{HCLK} = 8\text{MHz}$	1.0	0.5	
$F_{HCLK} = 4\text{MHz}$	0.7		0.4			
$F_{HCLK} = 500\text{kHz}$	0.4	0.3				

Note: The above are measured parameters.

Table 4-8 Typical current consumption in Stop and Standby mode

Symbol	Parameter	Condition	Typ.	Unit
$I_{DD}^{(1)}$	Supply current in Stop mode	Voltage regulator in Run mode, low-speed and high-speed internal RC oscillators and external oscillators off (no independent watchdog)	110	uA
		Voltage regulator in low-power mode, low-speed and high-speed internal RC oscillators and external oscillators off (no independent watchdog, PVD off), RAM enters low-power mode	30	

	Supply current in Standby mode	Low-speed internal RC oscillator and independent watchdog on, all RAM not powered	1.8	
		Low-speed internal RC oscillator on, independent watchdog off, all RAM not powered	1.8	
		LSI/LSE/RTC/IWDG off, 32K_RAM powered and in low-power mode	2.5	
		LSI/LSE/RTC/IWDG off, 2K_RAM powered and in low-power mode	1.2	
		LSI/LSE/RTC/IWDG off, all RAM not powered	1	
$I_{DD\_VBAT}^{(1)}$	Backup domain supply current (Remove $V_{DD}$ and $V_{DDA}$ , only powered by $V_{BAT}$ )	Low-speed external oscillator and RTC on	1.8	

Note: The above are measured parameters.

The CH32V317 chip has a built-in 10/100Mbps Ethernet PHY physical layer transceiver, and the current consumption of this module is shown in Table 4-9 below.

Table 4-8 Current consumption of 10/100Mbps Ethernet PHY module (only for CH32V317 chip)

Symbol	Parameter	Condition	Typ.	Unit
$I_{DD\_10/100M\_PHY}$	Supply current in transmission state	The link of 100BASE-TX path is successful and there are packets on the transceiver channel.	60.4	mA
		The link of 10BASE-TX path is successful and there are packets on the transceiver channel.	34.2	
	Supply current in idle state	The link of 100BASE-TX path is successful and there are no data packets on the transceiver channel.	61.4	
		The link of 10BASE-TX path is successful and there are no data packets on the transceiver channel.	28.1	
	Supply current in disconnected state	100BASE-TX and 10BASE-TX paths are not linked successfully and PHY is in auto-negotiation state.	38.4	
	Supply current in shutdown state	Only SMI interface in work state	0.2	

### 4.3.5 External Clock Source Characteristics

Table 4-10 From external high-speed clock

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
--------	-----------	-----------	------	------	------	------

$F_{HSE\_ext}$	External clock frequency		3	8	25	MHz
$V_{HSEH}^{(1)}$	OSC_IN input pin high level voltage		$0.8V_{IO}$		$V_{IO}$	V
$V_{HSEL}^{(1)}$	OSC_IN input pin low-level voltage		0		$0.2V_{IO}$	V
$C_{in(HSE)}$	OSC_IN input capacitance			5		pF
$DuCy_{HSE}$	Duty cycle			50		%
$I_L$	OSC_IN input leakage current				$\pm 1$	$\mu A$

Note: 1. Failure to meet this condition may cause level recognition error.

Figure 4-3 External high-frequency clock source circuit

Table 4-11 From external low-speed clock

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$F_{LSE\_ext}$	User external clock frequency			32.768	1000	kHz
$V_{LSEH}$	OSC32_IN input pin high level voltage		$0.8V_{DD}$		$V_{DD}$	V
$V_{LSEL}$	OSC32_IN input pin low voltage		0		$0.2V_{DD}$	V
$C_{in(LSE)}$	OSC32_IN input capacitance			5		pF
$DuCy_{(LSE)}$	Duty cycle			50		%
$I_L$	OSC32_IN input leakage current				$\pm 1$	$\mu A$

Figure 4-4 External low-frequency clock source circuit

Table 4-12 High-speed external clock generated from a crystal/ceramic resonator

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$F_{OSC\_IN}$	Resonator frequency		3	8	25	MHz
$R_F$	Feedback resistance			250		k $\Omega$

C	Recommended load capacitance and corresponding crystal series impedance RS	$R_S=60\Omega^{(1)}$		30		pF
$I_2$	HSE drive current	$V_{DD} = 3.3V, 20p$ load		0.53		mA
$g_m$	Oscillator transconductance	Startup		17		mA/V
$t_{SU(HSE)}$	Startup time	$V_{DD}$ is stable, 8M crystal		1.5	4	ms

Note 1: It is recommended that the ESR of 25M crystal should not exceed 60  $\Omega$ , and it can be relaxed if it is lower than 25M.

2. For CH32V317 chip, the crystal frequency deviation is recommended to be within  $\pm 40ppm$ .

Circuit reference design and requirements:

The load capacitance of the crystal is subject to the recommendation of the crystal manufacturer,  $C_{L1}=C_{L2}$ .

Figure 4-5 Typical circuit of external 8M crystal

Table 4-13 Low-speed external clock generated by generated from a crystal/ceramic resonator ( $f_{LSE}=32.768kHz$ )

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$R_F$	Feedback resistance			5		M $\Omega$
C	Recommended load capacitance and corresponding crystal serial impedance $R_s$	$R_S < 70k\Omega$			15	pF
$i_2$	LSE drive current	$V_{DD} = 3.3V$		0.35		$\mu A$
$g_m$	Oscillator transconductance	Startup		25.3		$\mu A/V$
$t_{SU(LSE)}$	Startup time	$V_{DD}$ is stable		800		mS

Circuit reference design and requirements:

The load capacitance of the crystal is subject to the recommendation of the crystal manufacturer,  $C_{L1}=C_{L2}$ , generally 12pF is recommended.

Figure 4-6 Typical circuit of external 32.768K crystal

Note: The load capacitance  $C_L$  is calculated by the following formula:  $C_L = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{stray}$ .  $C_{stray}$  is the capacitance of the pin and the PCB board or PCB-related capacitance. Its typical value is between 2pF and 7pF.

### 4.3.6 Internal Clock Source Characteristics

Table 4-14 Internal high-speed (HSI) RC oscillator characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$F_{HSI}$	Frequency (after calibration)			8		MHz
$DuCy_{HSI}$	Duty cycle		45	50	55	%
$ACC_{HSI}$	Accuracy of HSI oscillator (after calibration)	$TA = 0^{\circ}C \sim 70^{\circ}C$	-1.8		1.8	%
		$TA = -40^{\circ}C \sim 85^{\circ}C$	-3.0		2.5	%
$t_{SU(HSI)}$	HSI oscillator startup stabilization time				8	us
$I_{DD(HSI)}$	HSI oscillator power consumption		120	180	270	uA

Note: 1. Set register `RCC_CTLR_HSION 1`, waiting for `HSIRDY` to set 1.

Table 4-15 Internal low-speed (LSI) RC oscillator characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$F_{LSI}$	Frequency		25	39	60	kHz
$DuCy_{LSI}$	Duty cycle		45	50	55	%
$t_{SU(LSI)}$	LSI oscillator startup stabilization time	LSE on		230		us
		LSE off		5		ms
$I_{DD(LSI)}$	LSI oscillator power consumption			0.6		uA

### 4.3.7 PLL Characteristics

Table 4-16 PLL characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$F_{PLL\_IN}$	PLL input clock		3	8	25	MHz
	PLL input clock duty cycle		40		60	%
$F_{PLL\_OUT}$	PLL multiplier output clock		18		144 <sup>(1)</sup>	MHz
$t_{LOCK}$	PLL lock time			80	200	us

Note 1: The frequency multiplier must be selected to meet the PLL output frequency range.

Table 4-17 PLL2 and PLL3 characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$F_{PLL\_IN}$	PLL input clock		3		25	MHz
	PLL input clock duty cycle1		40		60	%
$F_{PLL\_OUT}$	PLL multiplier output clock		30		75 <sup>(1)</sup>	MHz
$F_{VCO}$	VCO output clock		60		150	MHz
$t_{LOCK1}$	PLL lock time			80	200	us

Note 1: The frequency multiplier must be selected to meet the PLL output frequency range.

### 4.3.8 Wakeup Time from Low-power Mode

Table 4-18 Wakeup time from low-power mode<sup>(1)</sup>

Symbol	Parameter	Condition	Typ.	Unit

$t_{wusleep}$	Wakeup from Sleep mode	Wake up using HSI RC clock	2.4	us
$t_{wustop}$	Wakeup from Stop mode (voltage regulator is in Run mode)	Wake on HSI RC clock	23.1	us
	Wakeup from Stop mode (voltage regulator is in low-power mode)	Voltage regulator wake-up time from low-power mode + HSI RC clock wake up	76.7	us
$t_{WUSTDBY}$	Wakeup from Standby mode	LDO stabilization time + HSI RC clock wake up + code load time <sup>(2)</sup> (take 256K as example)	8.9	ms

Note: 1. The above parameters are measured parameters.

2. The code load time is calculated based on the current zero-wait area capacity configured by the chip and the size of the loading configuration clock.

### 4.3.9 Memory Characteristics

Table 4-19 Flash memory characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$F_{prog}$	Programming frequency <sup>(1)</sup>	$T_A = -40^{\circ}\text{C} \sim 85^{\circ}\text{C}$			60	MHz
$t_{prog\_page}$	Page (256 bytes) programming time	$T_A = -40^{\circ}\text{C} \sim 85^{\circ}\text{C}$		2	2.5	ms
$t_{erase\_page}$	Page (256 bytes) erase time	$T_A = -40^{\circ}\text{C} \sim 85^{\circ}\text{C}$		16	20	ms
$t_{erase\_sec}$	Sector (4K bytes) erase time	$T_A = -40^{\circ}\text{C} \sim 85^{\circ}\text{C}$		16	20	ms
$V_{prog}$	Programming voltage		2.4		3.6	V

Note: 1. For the programming frequency of flash, read operation, program operation and erase operation are included. The clock is from HCLK.

Table 4-20 Flash memory endurance and data retention

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$N_{END}$	Endurance	$T_A = 25^{\circ}\text{C}$	10K	80K <sup>(1)</sup>		times
$t_{RET}$	Data retention		20			year

Note: The endurance parameter is actual measured, which is not guaranteed.

### 4.3.10 I/O Port Characteristics

Table 4-21 General-purpose I/O static characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$V_{IH}$	Standard I/O pin, input high-level voltage		$0.41 \cdot (V_{IO} - 1.8) + 1.3$		$V_{IO} + 0.3$	V
	FT I/O pin, input high level voltage		$0.42 \cdot (V_{IO} - 1.8) + 1$		5.5	V
$V_{IL}$	Standard I/O pin, input low-level voltage		-0.3		$0.28 \cdot (V_{IO} - 1.8) + 0.6$	V
	FT I/O pin, input low-level voltage		-0.3		$0.32 \cdot (V_{IO} - 1.8) + 0.55$	V

$V_{\text{hys}}$	Standard I/O pin Schmitt trigger voltage hysteresis		150			mV
	FT I/O pin Schmitt trigger voltage hysteresis		90			
$I_{\text{lk}}g$	Input leakage current	Standard I/O port			1	uA
		FT I/O port			3	
$R_{\text{PU}}$	Pull-up equivalent resistance		30	40	50	k $\Omega$
$R_{\text{PD}}$	Pull-down equivalent resistance		30	40	50	k $\Omega$
$C_{\text{I/O}}$	I/O pin capacitance			5		pF

#### Output drive current characteristics

GPIO (General-Purpose Input/Output Port) can sink or output up to  $\pm 8\text{mA}$  current, and sink or output  $\pm 20\text{mA}$  current (not strictly to  $V_{\text{OL}}/V_{\text{OH}}$ ). In user applications, the total driving current of all I/O pins cannot exceed the absolute maximum ratings given in Section 4.2:

Table 4-22 Output voltage characteristics

Symbol	Parameter	Condition	Min.	Max.	Unit
$V_{\text{OL}}$	Output low level, 8 pins sink current	TTL port, $I_{\text{IO}} = +8\text{mA}$		0.4	V
$V_{\text{OH}}$	Output high level, 8 pins source current	$2.7\text{V} < V_{\text{DD}} < 3.6\text{V}$	$V_{\text{DD}} - 0.4$		
$V_{\text{OL}}$	Output low level, 8 pins sink current	CMOS port, $I_{\text{IO}} = +8\text{mA}$		0.4	V
$V_{\text{OH}}$	Output high level, 8 pins source current	$2.7\text{V} < V_{\text{DD}} < 3.6\text{V}$	$V_{\text{DD}} - 0.4$		
$V_{\text{OL}}$	Output low level, 8 pins sink current	$I_{\text{IO}} = +20\text{mA}$		1.0	V
$V_{\text{OH}}$	Output high level, 8 pins source current	$2.7\text{V} < V_{\text{DD}} < 3.6\text{V}$	$V_{\text{DD}} - 1.2$		
$V_{\text{OL}}$	Output low level, 8 pins sink current	$I_{\text{IO}} = +6\text{mA}$		0.4	V
$V_{\text{OH}}$	Output high level, 8 pins source current	$2.4\text{V} < V_{\text{DD}} < 2.7\text{V}$	$V_{\text{DD}} - 0.6$		

Note: In the above conditions, if multiple IO pins are driven at the same time, the total current cannot exceed the absolute maximum ratings given in Table 4.2. In addition, when multiple I/O pins are driven at the same time, the current on the power/ground point is very large, which will cause the voltage drop to make the internal I/O voltage not reach the power supply voltage in the table, resulting in the drive current being less than the nominal value.

Table 4-23 Input/output AC characteristics

MODEx[1:0] configuration	Symbol	Parameter	Condition	Min.	Max.	Unit
10 (2MHz)	$F_{\text{max(IO)out}}$	Maximum frequency	$CL=50\text{pF}, V_{\text{DD}}=2.7-3.6\text{V}$		2	MHz
	$t_{\text{f(IO)out}}$	Output high to low fall time	$CL=50\text{pF}, V_{\text{DD}}=2.7-3.6\text{V}$		125	ns
	$t_{\text{r(IO)out}}$	Output low to high rise time			125	ns
01 (10MHz)	$F_{\text{max(IO)out}}$	Maximum frequency	$CL=50\text{pF}, V_{\text{DD}}=2.7-3.6\text{V}$		10	MHz
	$t_{\text{f(IO)out}}$	Output high to low fall time	$CL=50\text{pF}, V_{\text{DD}}=2.7-3.6\text{V}$		25	ns
	$t_{\text{r(IO)out}}$	Output low to high rise time			25	ns
11 (50MHz)	$F_{\text{max(IO)out}}$	Maximum frequency	$CL=30\text{pF}, V_{\text{DD}}=2.7-3.6\text{V}$		50	MHz
			$CL=50\text{pF}, V_{\text{DD}}=2.7-3.6\text{V}$		30	MHz
	$t_{\text{f(IO)out}}$	Output high to low fall time	$CL=30\text{pF}, V_{\text{DD}}=2.7-3.6\text{V}$		5	ns

	$t_{r(IO)out}$	Output low to high rise time	$CL=50pF, V_{DD}=2.7-3.6V$	8	ns
			$CL=30pF, V_{DD}=2.7-3.6V$	5	ns
			$CL=50pF, V_{DD}=2.7-3.6V$	8	ns
	$t_{EXTIpw}$	The EXTI controller detects the pulse width of the external signal		10	ns

### 4.3.11 NRST Pin Characteristics

Table 4-24 External reset pin characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$V_{IL(NRST)}$	NRST input low-level voltage		-0.3		$0.28*(V_{DD}-1.8)+0.6$	V
$V_{IH(NRST)}$	NRST input high-level voltage		$0.41*(V_{DD}-1.8)+1.3$		$V_{DD}+0.3$	V
$V_{hys(NRST)}$	NRST Schmitt Trigger voltage hysteresis		150			mV
$R_{PU}^{(1)}$	Pull-up equivalent resistance		30	40	50	k $\Omega$
$V_{F(NRST)}$	NRST input filtered pulse width				100	ns
$V_{NF(NRST)}$	NRST input not filtered pulse width		300			ns

Note: 1. The pull-up resistor is a real resistor in series with a switchable PMOS implementation. The resistance of this PMOS switch is very small (approximately 10%).

Circuit reference design and requirements:

Figure 4-7 Typical circuit of external reset pin

### 4.3.12 TIM Timer Characteristics

Table 4-25 TIMx characteristics

Symbol	Parameter	Condition	Min.	Max.	Unit
$t_{res(TIM)}$	Timer reference clock		1		$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72MHz$	13.9		ns
$F_{EXT}$	Timer external clock frequency on CH1 to CH4		0	$f_{TIMxCLK}/2$	MHz
		$f_{TIMxCLK} = 72MHz$	0	36	MHz
$R_{esTIM}$	Timer resolution			16	bit

$t_{\text{COUNTER}}$	16-bit counter clock cycle when the internal clock is selected		1	65536	$t_{\text{TIMxCLK}}$
		$f_{\text{TIMxCLK}} = 72\text{MHz}$	0.0139	910	us
$t_{\text{MAX\_COUNT}}$	Maximum possible count			65535	$t_{\text{TIMxCLK}}$
		$f_{\text{TIMxCLK}} = 72\text{MHz}$		59.6	s

### 4.3.13 I2C Interface Characteristics

Figure 4-8 I2C bus timing diagram

Table 4-26 I2C interface characteristics

Symbol	Parameter	Standard I2C		Fast I2C		Unit
		Min.	Max.	Min.	Max.	
$t_{w(SCKL)}$	SCL clock low time	4.7		1.2		us
$t_{w(SCKH)}$	SCL clock high time	4.0		0.6		us
$t_{SU(SDA)}$	SDA data setup time	250		100		ns
$t_H(SDA)$	SDA data hold time	0		0	900	ns
$t_r(SDA)/t_r(SCL)$	SDA and SCL rise time		1000	20		ns
$t_f(SDA)/t_f(SCL)$	SDA and SCL fall time		300			ns
$t_h(STA)$	Start condition hold time	4.0		0.6		us
$t_{SU(STA)}$	Repeated start condition setup time	4.7		0.6		us
$t_{SU(STO)}$	Stop condition setup time	4.0		0.6		us
$t_{w(STO:STA)}$	Time from stop condition to start condition (bus free)	4.7		1.2		us
$C_b$	Capacitive load for each bus		400		400	pF

### 4.3.14 SPI Interface Characteristics

Figure 4-9 SPI timing diagram in Master mode

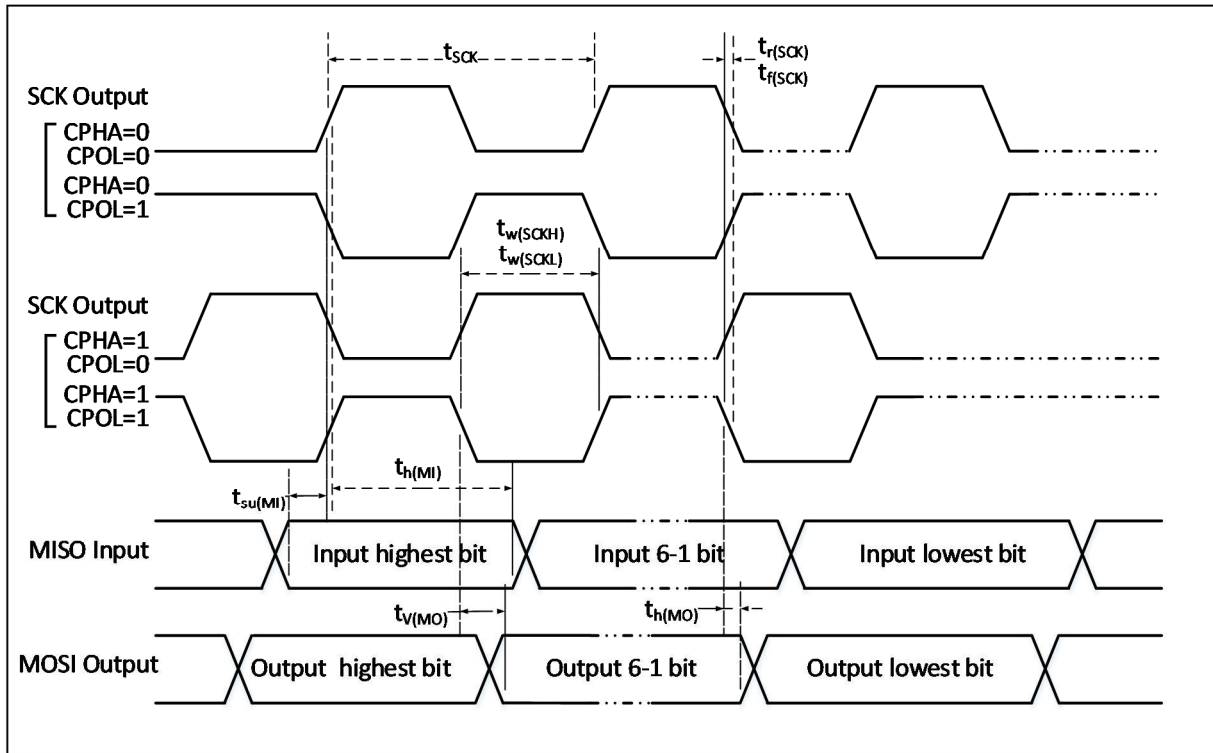

Figure 4-10 SPI timing diagram in Slave mode (CPHA=0)

Figure 4-11 SPI timing diagram in Slave mode (CPHA=1)

Table 4-27 SPI interface characteristics

Symbol	Parameter	Condition	Min.	Max.	Unit
$f_{SCK}/t_{SCK}$	SPI clock frequency	Master mode		72	MHz
		Slave mode		72	MHz
$t_{r(SCK)}/t_{f(SCK)}$	SPI clock rise and fall time	Load capacitance:C = 30pF		20	ns
$t_{su(NSS)}$	NSS setup time	Slave mode	$2t_{PCLK}$		ns
$t_{h(NSS)}$	NSS hold time	Slave mode	$2t_{PCLK}$		ns
$t_{w(SCKH)}/t_{w(SCKL)}$	SCK high and low time	Master mode, $f_{PCLK} = 36\text{MHz}$ , Prescaler factor = 4	40	60	ns
$t_{su(MI)}$	Data input setup time	Master mode	5		ns
$t_{su(SI)}$		Slave mode	5		ns
$t_{h(MI)}$	Data input hold time	Master mode	5		ns
$t_{h(SI)}$		Slave mode	4		ns
$t_{a(SO)}$	Data output access time	Slave mode, $f_{PCLK} = 20\text{MHz}$	0	$1t_{PCLK}$	ns
$t_{dis(SO)}$	Data output disable time	Slave mode	0	10	ns
$t_{v(SO)}$	Data output valid time	Slave mode (After enable edge)		25	ns
$t_{v(MO)}$		Master mode (After enable edge)		5	ns
$t_{h(SO)}$	Data output hold time	Slave mode (After enable edge)	15		ns
$t_{h(MO)}$		Master mode (After enable edge)	0		ns

### 4.3.15 I2S Interface Characteristics

Figure 4-12 I2S master timing diagram (Philips protocol)

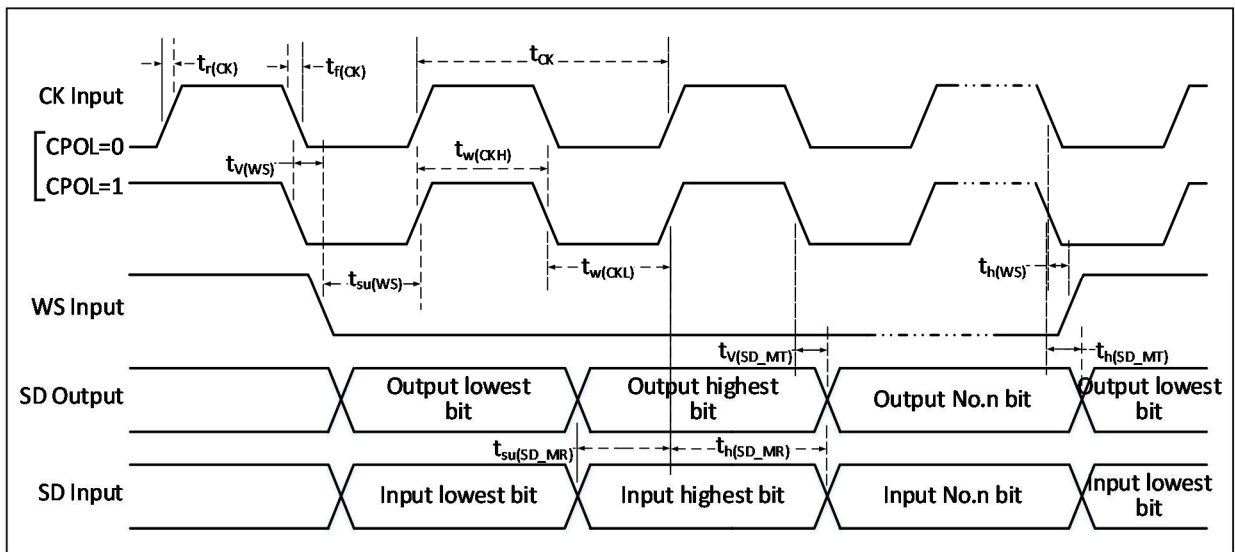

Figure 4-13 I2S slave timing diagram (Philips protocol)

Table 4-28 I2S interface characteristics

Symbol	Parameter	Condition	Min.	Max.	Unit
$f_{CK}/t_{CK}$	I <sup>2</sup> S clock frequency	Master mode		8	MHz
		Slave mode		8	MHz
$t_{r(CK)}/t_{f(CK)}$	I <sup>2</sup> S clock rise and fall time	Load capacitance: C = 30pF		20	ns
$t_{v(WS)}$	WS valid time	Master mode		5	ns
$t_{su(WS)}$	WS setup time	Slave mode	10		ns
$t_{h(WS)}$	WS hold time	Master mode	0		ns
		Slave mode	0		ns
$t_{w(CKH)}/t_{w(CKL)}$	SCK high and low time	Master mode, $f_{PCLK} = 36\text{MHz}$ ,	40	60	%

		Prescaler factor =4			
$t_{SU(SD\_MR)}$	Data input setup time	Master mode	8		ns
$t_{SU(SD\_SR)}$		Slave mode	8		ns
$t_{h(SD\_MR)}$	Data input hold time	Master mode	5		ns
$t_{h(SD\_SR)}$		Slave mode	4		ns
$t_{h(SD\_MT)}$	Data output hold time	Master mode (After enable edge)		5	ns
$t_{h(SD\_ST)}$		Slave mode (After enable edge)		5	ns
$t_{V(SD\_MT)}$	Data output valid time	Master mode (After enable edge)		5	ns
$t_{V(SD\_ST)}$		Slave mode (After enable edge)		4	ns

### 4.3.16 USB Interface Characteristics

Table 4-29 USB characteristics

Symbol	Parameter	Condition	Min.	Max.	Unit
$V_{DD}$	USB operating voltage		3.0	3.6	V
$V_{SE}$	Single-ended receiver threshold	$V_{DD} = 3.3V$	1.2	1.9	V
$V_{OL}$	Static output low level			0.3	V
$V_{OH}$	Static output high level		2.8	3.6	V
$V_{HSSQ}$	High-speed suppression information detection threshold		100	150	mV
$V_{HSDSC}$	High-speed disconnection detection threshold		500	625	mV
$V_{HSOI}$	High-speed idle level		-10	10	mV
$V_{HSOH}$	High-speed data high level		360	440	mV
$V_{HSOL}$	High-speed data low level		-10	10	mV

### 4.3.17 SD/MMC Interface Characteristics

Figure 4-14 SD high-speed timing diagram

Figure 4-15 SD default timing diagram

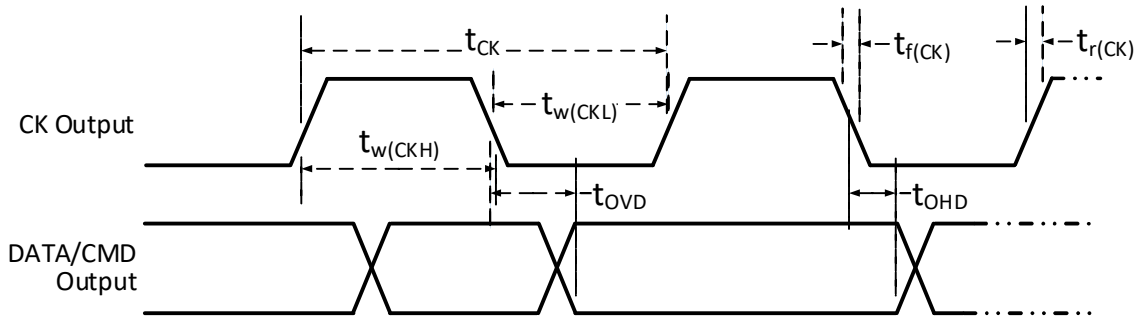

Table 4-30 SD/MMC interface characteristics

Symbol	Parameter	Condition	Min.	Max.	Unit	
$f_{CK}/t_{CK}$	Clock frequency in data transfer mode	$CL \leq 30pF$		48	MHz	
$t_{w(CKL)}$	Clock low time	$CL \leq 30pF$	6		ns	
$t_{w(CKH)}$	Clock high time	$CL \leq 30pF$	6			
$t_{r(CK)}$	Rise Time	$CL \leq 30pF$		4		
$t_{f(CK)}$	Fall time	$CL \leq 30pF$		4		
CMD/DAT input (refer to CK)						
$t_{ISU}$	Input setup time	$CL \leq 30pF$	7		ns	
$t_{IH}$	Input hold time	$CL \leq 30pF$	2			
CMD/DAT output in high-speed mode (refer to CK)						
$t_{OV}$	Output valid time	$CL \leq 30pF$	Master mode		5	ns
			Slave mode		9	
$t_{OH}$	Output hold time	$CL \leq 30pF$	20			
CMD/DAT output in default mode (refer to CK)						
$t_{OVD}$	Output valid default time	$CL \leq 30pF$	Master mode		8	ns
			Slave mode		14	
$t_{OHD}$	Output hold default time	$CL \leq 30pF$	20			

### 4.3.18 FSMC Characteristics

Figure 4-16 Asynchronous multiplexed PSRAM/NOR read waveform

Table 4-31 Asynchronous multiplexed PSRAM/NOR read timings

Symbol	Parameter	Min.	Max.	Unit
$t_{w(NE)}$	FSMC_NE low time	$7t_{HCLK}$		ns
$t_{v(NOE\_NE)}$	FSMC_NE low to FSMC_NOE low	0		
$t_{w(NOE)}$	FSMC_NOE low time	$7t_{HCLK}$		
$t_{h(NE\_NOE)}$	FSMC_NOE high to FSMC_NE high hold time	0		
$t_{v(A\_NE)}$	FSMC_NE low to FSMC_A valid	0	5	
$t_{v(NADV\_NE)}$	FSMC_NE low to FSMC_NADV low	0	5	
$t_{w(NADV)}$	FSMC_NADV low time	$t_{HCLK}$		
$t_{h(AD\_NADV)}$	FSMC_AD (address) valid hold time after FSMC_NADV high	$2t_{HCLK}$		
$t_{h(A\_NOE)}$	Address hold time after FSMC_NOE high	0		
$t_{h(BL\_NOE)}$	FSMC_BL hold time after FSMC_NOE high	0		
$t_{v(BL\_NE)}$	FSMC_NE low to FSMC_BL valid	0	5	
$t_{SU(DATA\_NE)}$	Data to FSMC_NE high setup time	$3t_{HCLK}$		
$t_{SU(DATA\_NOE)}$	Data to FSMC_NOE high setup time	$3t_{HCLK}$		
$t_{h(DATA\_NE)}$	Data hold time after FSMC_NE high	0		
$t_{h(DATA\_NOE)}$	Data hold time after FSMC_NOE high	0		

Figure 4-17 Asynchronous multiplexed PSRAM/NOR write waveform

Table 4-32 Asynchronous multiplexed PSRAM/NOR write timings

Symbol	Parameter	Min.	Max.	Unit
$t_{w(NE)}$	FSMC_NE low time	$5t_{HCLK}$		ns
$t_{v(NEW\_NE)}$	FSMC_NE low to FSMC_NWE low	$3t_{HCLK}$		
$t_{w(NWE)}$	FSMC_NWE low time	$2t_{HCLK}$		
$t_{h(NE\_NWE)}$	FSMC_NWE high to FSMC_NE high hold time	$t_{HCLK}$		
$t_{v(A\_NE)}$	FSMC_NE low to FSMC_A valid	0	5	
$t_{v(NADV\_NE)}$	FSMC_NE low to FSMC_NADV low	0	5	
$t_{w(NADV)}$	FSMC_NADV low time	$t_{HCLK}$		
$t_{h(AD\_NADV)}$	FSMC_AD (address) valid hold time after FSMC_NADV high	$2t_{HCLK}$		
$t_{h(A\_NWE)}$	Address hold time after FSMC_NWE high	$t_{HCLK}$		
$t_{v(BL\_NE)}$	FSMC_NE low to FSMC_BL valid	0	5	
$t_{h(BL\_NWE)}$	FSMC_BL hold time after FSMC_NWE high	$t_{HCLK}$		
$t_{v(DATA\_NADV)}$	FSMC_NADV high to data hold time	$2t_{HCLK}$		
$t_{h(DATA\_NWE)}$	Data hold time after FSMC_NWE high	$t_{HCLK}$		

Figure 4-18 Synchronous multiplexed NOR/PSRAM read waveform

Table 4-33 Synchronous multiplexed NOR/PSRAM read timings

Symbol	Parameter	Min.	Max.	Unit
$t_{w(CLK)}$	FSMC_CLK period	$2t_{HCLK}$		ns
$t_{d(CLKL\_NEL)}$	FSMC_CLK low to FSMC_NE low	0	5	
$t_{d(CLKH\_NEH)}$	FSMC_CLK high to FSMC_NE high	$0.5t_{HCLK}$	$0.5t_{HCLK}$	
$t_{d(CLKL\_NADV)}$	FSMC_CLK low to FSMC_NADV low	0	5	
$t_{d(CLKL\_NADVH)}$	FSMC_CLK low to FSMC_NADV high	0	5

Figure 4-23 NAND controller write waveform in general-purpose storage space

Table 4-35 Timing characteristics of NAND Flash read and write cycles

Symbol	Parameter	Min.	Max.	Unit
$t_{d(D-NWE)}$	Before FSMC_NWE high to FSMC_D[15:0] data valid	$4t_{HCLK}$		ns
$t_w(NOE)$	FSMC_NOE low time	$4t_{HCLK}$		
$t_{su(D-NOE)}$	Before FSMC_NOE high to FSMC_D[15:0] data valid	20		
$t_h(NOE-D)$	After FSMC_NOE high to FSMC_D[15:0] data valid	15		
$t_w(NWE)$	FSMC_NWE low time	$4t_{HCLK}$		
$t_v(NWE-D)$	FSMC_NWE low to FSMC_D[15:0] data valid	0		
$t_h(NWE-D)$	FSMC_NWE high to FSMC_D[15:0] data invalid	$2t_{HCLK}$		
$t_d(ALE-NWE)$	Before FSMC_NWE low to FSMC_ALE valid	$2t_{HCLK}$		
$t_h(NWE-ALE)$	FSMC_NWE high to FSMC_ALE invalid	$2t_{HCLK}$		
$t_d(ALE-NOE)$	Before FSMC_NOE low to FSMC_ALE valid	$2t_{HCLK}$		
$t_h(NOE-ALE)$	FSMC_NOE high to FSMC_ALE invalid	$4t_{HCLK}$		

### 4.3.19 DVP Interface Characteristics

Figure 4-24 DVP timing waveform

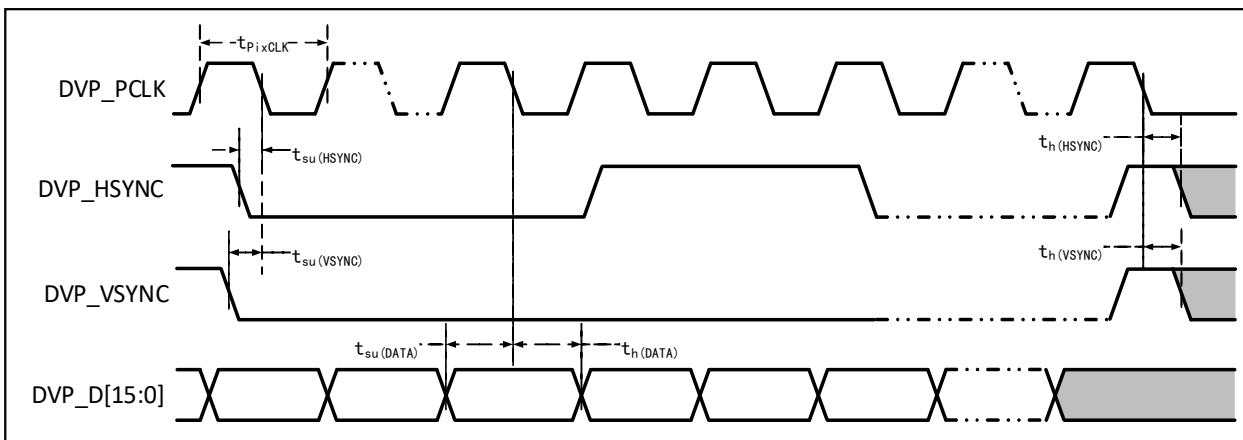

Table 4-36 DVP characteristics

Symbol	Parameter	Min.	Max.	Unit
$f_{\text{PIXCLK}}/t_{\text{PIXCLK}}$	Pixel clock input frequency		144	MHz
Duty(PiXCLK)	Pixel clock duty cycle	15		%
$t_{\text{su}}(\text{DATA})$	Data setup time	2.5		ns
$t_{\text{h}}(\text{DATA})$	Data hold time	1		
$t_{\text{su}}(\text{HSYNC})/t_{\text{su}}(\text{VSYNC})$	HSYNC/VSYNC signal input setup time	2.5		
$t_{\text{h}}(\text{HSYNC})/t_{\text{h}}(\text{VSYNC})$	HSYNC/VSYNC signal input hold time	1		

### 4.3.20 Gigabit Ethernet Interface Characteristics

Figure 4-25 ETH-SMI timing waveform

Table 4-37 SMI signal characteristics of Ethernet MAC

Symbol	Parameter	Min.	Typ.	Max.	Unit
$f_{\text{MDC}}/t_{\text{MDC}}$	MDC clock frequency			2.5	MHz
$t_{\text{d}}(\text{MDIO})$	MDIO write data valid time	0		300	ns
$t_{\text{su}}(\text{MDIO})$	Read data setup time	10			
$t_{\text{h}}(\text{MDIO})$	Read data hold time	10			

Figure 4-26 ETH-RMII signal timing waveform

Table 4-38 RMII signal characteristics of Ethernet MAC

Symbol	Parameter	Min.	Typ.	Max.	Unit
$t_{su(RXD)}$	Setup time of received data	4			ns
$t_{ih(RXD)}$	Hold time of received data	2			
$t_{su(CRS\_DV)}$	Carrier detect signal setup time	4			
$t_{ih(CRS\_DV)}$	Carrier detect signal hold time	2			
$t_d(TXEN)$	Transmission enable effective delay time			16	
$t_d(TXD)$	Data transmission effective delay time			16	

Figure 4-27 ETH-MII signal timing waveform

Table 4-39 MII signal characteristics of Ethernet MAC

Symbol	Parameter	Min.	Typ.	Max.	Unit
$t_{su(RXD)}$	Setup time of received data	10			ns
$t_{ih(RXD)}$	Hold time of received data	10			
$t_{su(DV)}$	Data valid signal setup time	10			
$t_{ih(DV)}$	Data valid signal hold time	10			
$t_{su(ER)}$	Error signal setup time	10			
$t_{ih(ER)}$	Error signal hold time	10			
$t_d(TXEN)$	Transmission enable effective delay time			16	
$t_d(TXD)$	Data transmission effective delay time			16	

Figure 4-28 ETH-RGMII signal timing waveform

Table 4-40 RGMII signal characteristics of Ethernet MAC

Symbol	Parameter	Min.	Typ.	Max.	Unit
$f_{TXC}/t_{TXC}$	TXC/RXC clock frequency	7.2	8	8.8	ns
$t_R$	TXC/RXC rise time			2.0	
$t_F$	TXC/RXC fall time			2.0	
$t_{su}(TDATA)$	Transmit data setup time	1.2	2.0		
$t_h(TDATA)$	Transmit data hold time	1.2	2.0		
$t_{su}(RDATA)$	Input data setup time	1.2	2.0		
$t_h(RDATA)$	Input data hold time	1.2	2.0		

### 4.3.21 12-bit ADC Characteristics

Table 4-41 ADC characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$V_{DDA}$	Supply voltage		2.4		3.6	V
$V_{REF+}$	Positive reference voltage	$V_{REF+}$ cannot be more than $V_{DDA}$	2.4		$V_{DDA}$	V
$I_{VREF}$	Reference current			160	220	uA
$I_{DDA}$	Supply current			480	530	uA
$f_{ADC}$	ADC clock frequency				14	MHz
$f_s$	Sampling rate		0.05		1	MHz
$f_{TRIG}$	External trigger frequency				16	$1/f_{ADC}$
$V_{AIN}$	Conversion voltage range		0		$V_{REF+}$	V
$R_{AIN}$	External input impedance				50	k $\Omega$
$R_{ADC}$	Sampling switch resistance			0.6	1	k $\Omega$
$C_{ADC}$	Internal sample and hold capacitor			8		pF

$t_{CAL}$	Calibration time			40		$1/f_{ADC}$
$t_{lat}$	Injected trigger conversion latency				2	$1/f_{ADC}$
$t_{latr}$	Regular trigger conversion latency				2	$1/f_{ADC}$
$t_s$	Sampling time		1.5		239.5	$1/f_{ADC}$
$t_{STAB}$	Power-on time				1	us
$t_{CONV}$	Total conversion time (including sampling time)		14		252	$1/f_{ADC}$

Note: Above parameters are guaranteed by design.

Formula: Maximum  $R_{AIN}$

$$R_{AIN} < \frac{T_s}{f_{ADC} \times C_{ADC} \times \ln 2^{N+2}} - R_{ADC}$$

The above formula is used to determine the maximum external impedance so that the error can be less than 1/4 LSB. Where N=12 (representing 12-bit resolution).

Table 4-42 Maximum  $R_{AIN}$  when  $f_{ADC} = 14\text{MHz}$

$T_s(\text{cycle})$	$t_s(\text{us})$	Maximum $R_{AIN}(\text{k}\Omega)$
1.5	0.11	0.4
7.5	0.54	5.9
13.5	0.96	11.4
28.5	2.04	25.2
41.5	2.96	37.2
55.5	3.96	50
71.5	5.11	Invalid
239.5	17.1	Invalid

Table 4-43 ADC error

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
EO	Offset error	$f_{PCLK2} = 56\text{MHz}$ , $f_{ADC} = 14\text{MHz}$ , $R_{AIN} < 10\text{k}\Omega$ , $V_{DDA} = 3.3\text{V}$		$\pm 4$		LSB
ED	Differential nonlinearity error			$\pm 0.5$	$\pm 3$	
EL	Integral nonlinearity error			$\pm 1$	$\pm 4$	

$C_p$  represents the parasitic capacitance on the PCB and the pad (about 5pF), which may be related to the quality of the pad and PCB layout. A larger  $C_p$  value will reduce the conversion accuracy, the solution is to reduce the  $f_{ADC}$  value.

Figure 4-29 ADC typical connection diagram

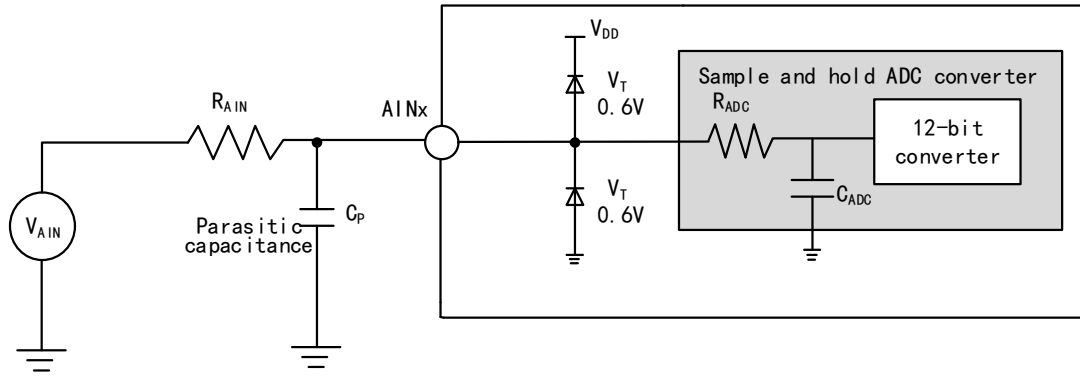

Figure 4-30 Analog power supply and decoupling circuit reference

### 4.3.22 Temperature Sensor Characteristics

Table 4-44 Temperature sensor characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
R <sub>TS</sub>	Measurement range of temperature sensor		-40		85	°C
A <sub>TSC</sub>	Measurement range of temperature sensor after software calibration			±12		°C
Avg_Slope	Average slope (negative temperature coefficient)		3.8	4.3	4.7	mV/°C
V <sub>25</sub>	Voltage at 25°C		1.34	1.40	1.46	V
T <sub>S_temp</sub>	ADC sampling time when reading temperature	f <sub>ADC</sub> = 14MHz			17.1	us

### 4.3.23 DAC Characteristics

Table 4-45 DAC characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
V <sub>DDA</sub>	Supply voltage		2.4	3.3	3.6	V
V <sub>REF+</sub>	Positive reference voltage	V <sub>REF+</sub> ≤ V <sub>DDA</sub>	2.4	3.3	3.6	V
R <sub>L</sub> <sup>(1)</sup>	Resistive load with buffer ON		5			kΩ
	Resistive load with buffer OFF		15			kΩ
C <sub>L</sub> <sup>(1)</sup>	Capacitive load with buffer ON				50	pF

$V_{OUT\_MIN}^{(1)}$	12-bit DAC conversion with buffer		0		8	mV
$V_{OUT\_MAX}^{(1)}$	ON	$V_{REF+}=3.3V$	3.29		3.3	V
$V_{OUT\_MIN}^{(1)}$	12-bit DAC conversion with buffer		0		3	mV
$V_{OUT\_MAX}^{(1)}$	OFF	$V_{REF+}=3.3V$	3.295		3.3	V
$I_{VREF+}$	With no load, 0x800 on the inputs			58		uA
	With no load, 0xF1C at $V_{REF+}=3.6V$ on the inputs			194		
	With no load, 0x555 (worst) at $V_{REF+}=3.6V$ on the inputs			331		
$I_{DDA}$	With buffer ON and no load, 0x800 on the inputs			170		uA
	With buffer ON and no load, 0xF1C on the inputs at $V_{REF+}=3.6V$ ,			150		
	With buffer ON and no load, 0x555 (worst) at $V_{REF+}=3.6V$ on the inputs			170		
DNL	Differential nonlinearity error			$\pm 2$		LSB
INL	Integral nonlinearity error		After calibration of offset error and gain error	$\pm 4$		LSB
Offset	Offset error			$\pm 3$	$\pm 12$	mV
			$V_{REF+}=3.6V$		$\pm 10$	LSB
Gain error			DAC in 12-bit configuration	$\pm 0.4$		%
Amplifier gain <sup>(1)</sup>	Amplifier gain in open loop		5k $\Omega$ load (max)	80	85	dB
$t_{SETTLING}$	Setting time (full scale: for an input code transition between the lowest and the highest input codes when DAC_OUT reaches final value $\pm 1$ LSB)		$C_{LOAD} \leq 50pF$ $R_{LOAD} \geq 5k\Omega$	3	4	us
Update rate	Max frequency for a correct DAC_OUT change when small variation in the input code (from code i to i+1LSB),		$C_{LOAD} \leq 50pF$ $R_{LOAD} \geq 5k\Omega$		1	MS/s
$t_{WAKEUP}$	Time to wake up from off state (PDV18 changes from 1 to 0)		$C_{LOAD} \leq 50pF$ , $R_{LOAD} \geq 5k\Omega$ , input codes between the lowest and highest possible ones	6.5	10	us
PSRR <sup>(1)</sup>	Power supply rejection ratio (relative to $V_{DDA}$ ) (static DC measurement)		No $R_{LOAD}$ , $C_{LOAD} \leq 50pF$	-100	-75	dB

Note: 1. Guaranteed by design, not tested in production.

## 4.3.24 OPA Characteristics

Table 4-46-1 OPA characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$V_{DDA}$	Supply voltage		2.4	3.3	3.6	V
$C_{MIR}$	Common mode input voltage		0		$V_{DDA}$	V
$O_{SW}^{(3)}$	Output swing		0		$V_{DDA}$	V
$V_{IOFFSET}$	Input offset voltage			$\pm 2.5$	$\pm 8$	mV
$I_{LOAD}$	Drive current				600	$\mu A$
$I_{DDOPAMP}$	Current consumption	No load, static mode		195		$\mu A$
$C_{MRR}^{(1)}$	Common mode rejection ratio	@1kHz		96		dB
$P_{SRR}^{(1)}$	Power supply rejection ratio	@1kHz		86		dB
$A_V^{(1)}$	Open loop gain	$C_{LOAD}=5pF$		136		dB
$G_{BW}^{(1)}$	Unit gain bandwidth	$C_{LOAD}=5pF$		19		MHz
$P_M^{(1)}$	Phase margin	$C_{LOAD}=5pF$		93		°
$S_R^{(1)}$	Slew rate limited	$C_{LOAD}=5pF$		8		V/us
$t_{WAKUP}^{(1)}$	Shutdown to wakeup settling time, 0.1%	Input $V_{DDA}/2$ , $C_{LOAD} = 50pF$ , $R_{LOAD} = 4k\Omega$			0.5	$\mu s$
$R_{LOAD}$	Resistive load		4			$k\Omega$
$C_{LOAD}$	Capacitive load				50	pF
$V_{OHSAT}^{(2)}$	High saturation output voltage	$R_{LOAD}=4k\Omega$ , input $V_{DDA}$	$V_{DDA}-300$	$V_{DDA}-150$		mV
		$R_{LOAD}=20k\Omega$ , input $V_{DDA}$	$V_{DDA}-50$	$V_{DDA}-30$		
$V_{OLSAT}^{(2)}$	Low saturation output voltage	$R_{LOAD}=4k\Omega$ , input 0		3	10	mV
		$R_{LOAD}=20k\Omega$ , input 0		3	10	
$EN^{(1)}$	Equivalent input voltage noise	$R_{LOAD}=4k\Omega$ ,@1kHz		83		$\frac{nv}{\sqrt{Hz}}$
		$R_{LOAD}=4k\Omega$ ,@10kHz		42		

Note: 1. The source simulation is not a real measurement.

2. The load current limits the saturated output voltage.

3. When pins PE7, PE8, PE14 and PE15 are used for OPA output, their output swing is limited:  $0 \leq O_{SW} \leq 2V$  when  $V_{DDA} = 3.3V$ .

Table 4-46-1 OPA characteristics (High-speed mode)

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$V_{DDA}$	Supply voltage		2.4	3.3	3.6	V
$C_{MIR}$	Common mode input voltage		0		$V_{DDA}$	V
$O_{SW}^{(3)}$	Output swing		0		$V_{DDA}$	V
$V_{IOFFSET}$	Input offset voltage			$\pm 2.5$	$\pm 8$	mV
$I_{LOAD}$	Drive current				600	$\mu A$
$I_{DDOPAMP}$	Current consumption	No load, static mode		770		$\mu A$
$C_{MRR}^{(1)}$	Common mode rejection ratio	@1kHz		96		dB

$P_{SRR}^{(1)}$	Power supply rejection ratio	@1kHz		86		dB
$A_V^{(1)}$	Open loop gain	$C_{LOAD} = 5pF$		136		dB
$G_{BW}^{(1)}$	Unit gain bandwidth	$C_{LOAD} = 5pF$		53		MHz
$P_M^{(1)}$	Phase margin	$C_{LOAD} = 5pF$		93		°
$S_R^{(1)}$	Slew rate limited	$C_{LOAD} = 5pF$		16		V/us
$t_{WAKUP}^{(1)}$	Shutdown to wakeup settling time, 0.1%	Input $V_{DDA}/2$ , $C_{LOAD} = 50pF$ , $R_{LOAD} = 4k\Omega$			0.5	us
$R_{LOAD}$	Resistive load		4			k $\Omega$
$C_{LOAD}$	Capacitive load				30	pF
$V_{OHSAT}^{(2)}$	High saturation output voltage	$R_{LOAD} = 4k\Omega$ , input $V_{DDA}$	$V_{DDA}-300$	$V_{DDA}-150$		mV
		$R_{LOAD} = 20k\Omega$ , input $V_{DDA}$	$V_{DDA}-50$	$V_{DDA}-30$		
$V_{OLSAT}^{(2)}$	Low saturation output voltage	$R_{LOAD} = 4k\Omega$ , input 0		3	10	mV
		$R_{LOAD} = 20k\Omega$ , input 0		3	10	
$EN^{(2)}$	Equivalent input voltage noise	$R_{LOAD} = 4k\Omega$ ,@1kHz		83		$\frac{nv}{\sqrt{Hz}}$
		$R_{LOAD} = 4k\Omega$ ,@10kHz		42		

Note: 1. The source simulation is not a real measurement.

2. The load current limits the saturated output voltage.

3. When pins PE7, PE8, PE14 and PE15 are used for OPA output, their output swing is limited:  $0 \leq O_{SW} \leq 2V$  when  $V_{DDA} = 3.3V$ .

## Chapter 5 Package and Ordering Information

### Packages

Package Form	Body Size	Pin Pitch		Package Description	Packing Type
LQFP48	7*7mm	0.5mm	19.7mil	Low Profile Quad Flat Pack	CH32V303CBT6
LQFP64M	10*10mm	0.5mm	19.7mil	Low Profile Quad Flat Pack	CH32V303RBT6
LQFP64M	10*10mm	0.5mm	19.7mil	Low Profile Quad Flat Pack	CH32V303RCT6
LQFP100	14*14mm	0.5mm	19.7mil	Low Profile Quad Flat Pack	CH32V303VCT6
TSSOP20	4.4*6.5mm	0.65mm	25.6mil	Thin Shrink Small Outline Package	CH32V305FBP6
QFN28	4*4mm	0.4mm	15.7mil	Quad Flat No-Lead Package	CH32V305GBU6
LQFP48	7*7mm	0.5mm	19.7mil	Low Profile Quad Flat Pack	CH32V305CCT6
LQFP64M	10*10mm	0.5mm	19.7mil	Low Profile Quad Flat Pack	CH32V305RBT6
LQFP64M	10*10mm	0.5mm	19.7mil	Low Profile Quad Flat Pack	CH32V307RCT6
QFN68	8*8mm	0.4mm	15.7mil	Quad Flat No-Lead Package	CH32V307WCU6
LQFP100	14*14mm	0.5mm	19.7mil	Low Profile Quad Flat Pack	CH32V307VCT6
QFN68	8*8mm	0.4mm	15.7mil	Quad Flat No-Lead Package	CH32V317WCU6
LQFP100	14*14mm	0.5mm	19.7mil	Low Profile Quad Flat Pack	CH32V317VCT6

*Note: All dimensions are in millimeters. The pin center spacing values are nominal values, with no error. Other than that, the dimensional error is not greater than the greater of  $\pm 0.2\text{mm}$  or 10%.*

## Series Product Naming Rules

Example:                    CH32                    V                    303    R    8    T    6

Device family

F = Arm core, general-purpose MCU

V = QingKe RISC-V core, general-purpose MCU

L = QingKe RISC-V core, low-power MCU

X = QingKe RISC-V core, dedicated or special peripherals MCU

M = QingKe RISC-V core, built-in pre-drive motor MCU

Product type (\*) + product subseries (\*\*)

Product type	Product subseries
0 = QingKe V2/V4 core, Super value version, system frequency <=48M	03 = 16K Flash basic general-purpose, OPA 06 = 64K Flash versatile, OPA, dual serial port, TKey 35 = Connection, USB, USB PD/Type-C
1 = M3/QingKe V3/V4 core, Basic version, system frequency <=96M	03 = Connection, USB 05 = Connection, USB HS, SDIO, CAN 07 = Interconnected, USB HS, CAN, Ethernet, SDIO, FSMC
2 = M3/QingKe V4 non-floating-point core, Enhanced, system frequency <=144M	08 = Wireless, BLE5.x, CAN, USB, Ethernet 17 = Interconnected, USB HS, CAN, Ethernet (built-in PHY), SDIO, FSMC
3 = QingKe V4F floating-point core, Enhanced, system frequency <=144M	

Pin number

J = 8 pins      D = 12 pins      A = 16 pins      F = 20 pins      E = 24 pins  
G = 28 pins      K = 32 pins      T = 36 pins      C = 48 pins      R = 64 pins

W = 68 pins      V = 100 pins      Z = 144 pins

Flash memory size

4 = 16K Flash memory

6 = 32K Flash memory

7 = 48K Flash memory

8 = 64K Flash memory

B = 128K Flash memory

C = 256K Flash memory

Package

T = LQFP

U = QFN

R = QSOP

P = TSSOP

M = SOP

Temperature range

6 = -40°C~85°C (industrial-grade)

7 = -40°C~105°C (automotive-grade 2)

3 = -40°C~125°C (automotive-grade 1)

D = -40°C~150°C (automotive-grade 0)
